# COMPONENTS

INNOVATION AND EXCELLENCE IN  
PRECISION DATA ACQUISITION

## **COMPANY HISTORY**

Founded in 1970, DATEL is a multinational company located approximately 35 miles south of Boston in Mansfield, Massachusetts. Our modern 180,000 square-foot facility houses our administrative offices, components and sub-systems engineering groups, modular and sub-systems production facilities, and the most modern thin-film and thick-film hybrid production facility in the industry. DATEL's hybrid manufacturing operation is a fully certified MIL-STD-1772 facility, supporting our high quality standards.

Our worldwide sales network extends to every major data acquisition product marketplace. The people who implement this sales network are skilled professionals dedicated to providing our customers with the highest possible standards of data acquisition products available today.

## **PRODUCT INFORMATION**

DATEL offers one of the industry's broadest data acquisition product lines, meeting the rapidly growing need for components and sub-systems to interface with computers in industrial, commercial, scientific and military applications. These products employ five basic technologies: monolithic CMOS, monolithic bipolar, thin-film hybrid, thick-film hybrid and discrete component circuits. Many products employ a combination of these technologies to achieve higher levels of performance and complexity. The present product lines include: data converters, sample-hold amplifiers, analog multiplexers, amplifiers, data acquisition sub-systems, computer analog I/O boards, process monitor/controllers, digital panel meters, thermal printers, digital calibrators and power supplies.

# HOW TO USE THIS DATABOOK

If you know the **MODEL NUMBER**, use the Product Index on the first page.

If you know the **PRODUCT TYPE**, refer to the Subject Index on page two to determine the proper section, then refer to the **SELECTION GUIDE TABLE** at the beginning of that section.

If you want **PRICE** and **AVAILABILITY** information contact your local DATEL salesperson or representative.

For all **OTHER INFORMATION**, such as New Product Highlights, Available Literature, available High Reliability Product Programs, a listing of available DESC drawings, Substitution Guide and Ordering Guide, use the Subject Index.

# AVAILABLE LITERATURE

## DATEL'S ALL NEW DATA ACQUISITION HANDBOOK SERIES

The following additional Handbooks are presented in complete data sheet format and include Selection Guides, Application Notes, and Ordering Information.

**Volume 2. Data Acquisition Boards**

DVME, Multibus, PC Bus

**Volume 3. Industrial Monitor and Control Products**

Process Monitors, Digital Panel Meters, Thermal Panel Printers, Bench-top and Hand-held Calibrators

**Volume 4. Power Products**

DC/DC Converters, Power Supplies

Also available are the following Application Notes:

**AN-1** High-Speed A/D Converter Designs: Layout and Interfacing Pitfalls

**AN-2** Picking the Right Sample-and-Hold Amp for Various Data Acquisition Needs

**AN-3** Data Converters: Getting to Know Dynamic Specifications

**Data Acquisition and Conversion Handbook:**

A technical guide to A/D - D/A converters and their applications.

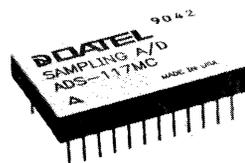

# NEW PRODUCTS

## ADS-117

12-Bit, 2.0 MHz, Low-Power  
Sampling A/D Converter

### Features

- 2.0 MHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 1.4 Watts
- Three-state output buffers
- Samples to Nyquist

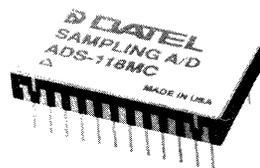

## ADS-118

12-Bit, 5.0 MHz, Low-Power  
Sampling A/D Converter

### Features

- 5.0 MHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 2.3 Watts
- Three-state output buffers
- Samples to Nyquist

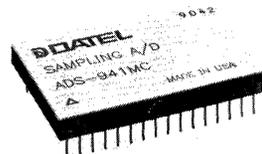

## ADS-941

14-Bit, 1.0 MHz, High Resolution  
Sampling A/D Converter

### Features

- 1.0 MHz minimum throughput
- Functionally complete
- Small 32-pin DIP
- Low-power, 2.8 Watts
- Three-state output buffers
- Samples up to Nyquist

## ADS-942

14-Bit, 2.0 MHz, High Resolution  
Sampling A/D Converter

### Features

- 2.0 MHz minimum throughput
- Functionally complete
- Small 32-pin DIP
- Low-power 2.9 Watts
- Three-state output buffers
- Samples up to Nyquist

## ADS-930

16-Bit, 500 KHz, High Resolution  
Sampling A/D Converter

### Features

- 500 KHz sampling rate
- Functionally complete
- Small 40-pin DIP
- Low-power, 1.8 Watts
- Three-state output buffers
- Samples up to Nyquist
- 16-Word FIFO memory

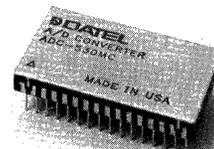

## ADC-530

12-Bit, Ultra-Fast, Low-Power  
A/D Converter

### Features

- 350 nSec MAX. conversion time
- Low-power, 2.1 Watts
- Small initial errors
- Three-state output buffers
- Small 32-pin DIP
- No missing codes

# NEW PRODUCTS

## HDAS-950/951

16-Bit, 100 KHz  
Data Acquisition Systems

### Features

- 16-bit resolution, 100 KHz
- 8 SE 4 D channels
- Miniature 40-pin DDIP
- Full-scale gain range from 100 mV to 10V
- High-impedance output state

## SHM-945

High-Speed, Hybrid  
Precision Sample/Hold

### Features

- 500 nSec MAX acquisition time to 0.00076%
- Differential input
- 0.0004% linearity
- 16-bit performance over military temperature range
- Small 24-pin DDIP package
- Operates at different gain settings

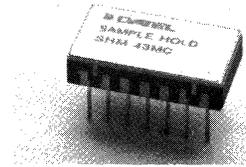

## SHM-43

High-Speed, 0.01%  
Hybrid Sample/Hold

### Features

- 35 nS MAX acquisition time to 0.01%
- 1 Picosecond aperture uncertainty
- 75 MHz small-signal bandwidth
- 520 Milliwatt maximum power dissipation
- Small 14-pin DIP package
- CMOS control signal

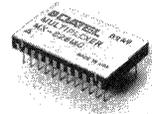

## MX-826

Precision, High-Speed  
Multiplexer

### Features

- 225 nSec Max. settling time to 0.01%
- 400 nSec. Max. settling time to 0.003%
- 150 nSec. Max. settling time to 0.1%
- 8 Channels single-ended inputs
- 395 Milliwatts power dissipation
- Small 24-pin DDIP package

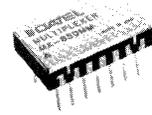

## MX-850

Precision, High Speed  
Multiplexer

### Features

- 50 Nanoseconds settling time to 0.01%
- 70 Nanoseconds settling time to 0.003%
- 100 Nanoseconds settling time to 0.001%
- 4 Channels, single-ended inputs
- 207 Milliwatts power dissipation
- Small 14-pin DIP package

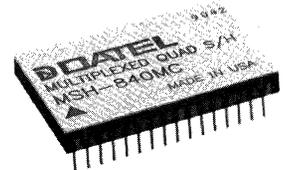

## MSH-840

Quad Simultaneous  
Sample Hold

### Features

- 4 Simultaneous sample/holds
- Internal 4 channel multiplexer
- 750 nSec acquisition time, 10V step to 0.01%
- 2 channels with optional X10 gain
- Control logic for interfacing to A/D's
- Low-power, 1.5 Watts

## SHM-49

High-Speed, 0.01%  
Hybrid Sample/Hold

### Features

- 16 MHz small signal bandwidth
- Small 8-pin DIP or LCC package
- 200 nS Max. acquisition time to 0.01%
- 72 dB feedthrough attenuation
- $\pm 25$  Picoseconds aperture uncertainty
- 413 Milliwatts power dissipation

# NEW PRODUCTS

## **ADS-120**

12-Bit, 20 MHz  
Sampling A/D Converter

### **Features**

- 20 MHz minimum throughput
  - Samples to Nyquist
  - Functionally complete
  - Small 40-pin DIP
  - Low-power, 4.2 Watts
  - Three-state output buffers
  - High input bandwidth
- 

## **ADS-944**

14-Bit, 5.0 MHz, High Resolution  
Sampling A/D Converter

### **Features**

- 5.0 MHz minimum throughput
  - Functionally complete
  - Small 32-pin DIP
  - Low-power, 3.4 Watts
  - Three-state output buffers
  - Samples to Nyquist
- 

## **ADS-945**

14-Bit, 10.0 MHz, High Resolution  
Sampling A/D Converter

### **Features**

- 10 MHz sampling rate
  - Functionally complete
  - Small 40-pin DIP
  - Low-power, 4.2 Watts
  - Three-state output buffers
  - Samples up to Nyquist
  - 16-Word FIFO memory
- 

## **ADS-976**

16-Bit, 200 KHz, Low-Power  
Sampling A/D Converter

### **Features**

- 200 KHz sampling rate
  - Compatible to industry standard ADC76, AD376, AD1376
  - Small 32-pin DIP
  - Low-power, 1.8 Watts
  - Samples to Nyquist
  - 16-Word FIFO memory
- 

## **FLT-DL**

4- and 5- Pole High Frequency  
Digitally Programmable  
Active Filters

### **Features**

- Digitally programmable
- 4- and 5-pole CAUER response
- Cascadable 7-pole CAUER response
- Cutoff frequencies to 1.2 MHz
- Small 32-pin DIP
- -55 to +125 °C operation

## SAMPLING A/D CONVERTERS

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 500 KHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 1.4 Watts
- Three-state output buffers
- No missing codes

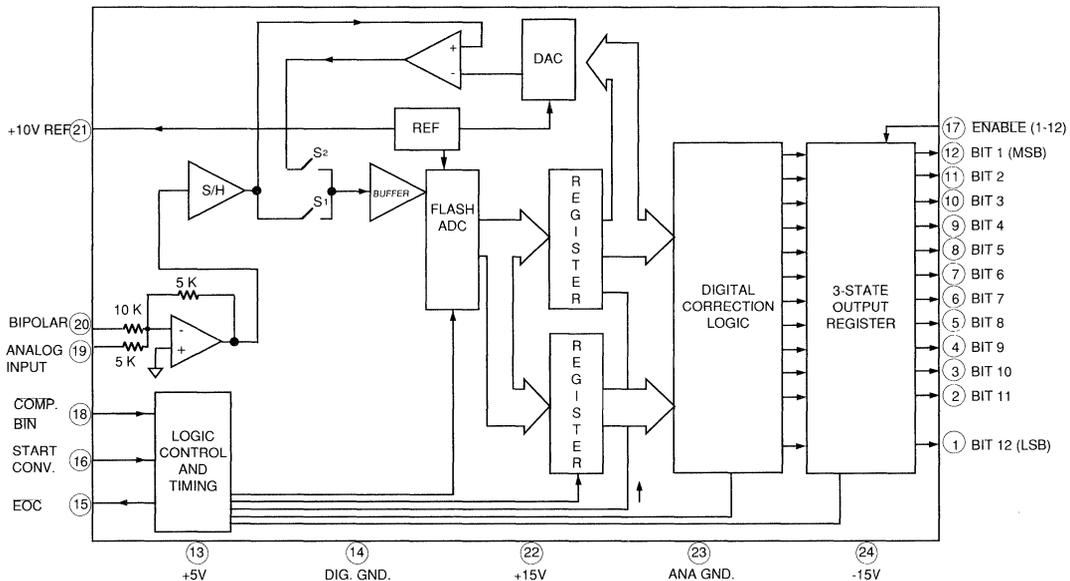

### GENERAL DESCRIPTION

DATEL's ADS-111 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a space-saving 24-pin ceramic DIP. A minimum throughput rate of 500 KHz is achieved while only dissipating 1.4 Watts.

Manufactured using thick-film and thin-film hybrid technology, a proprietary chip and unique laser trimming schemes, the ADS-111's exclusive performance is based upon a digitally-corrected subranging architecture.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION       |
|-----|------------------|-----|----------------|
| 1   | BIT 12 OUT (LSB) | 13  | +5V            |
| 2   | BIT 11 OUT       | 14  | DIGITAL GROUND |
| 3   | BIT 10 OUT       | 15  | EOC            |
| 4   | BIT 9 OUT        | 16  | START CONVERT  |
| 5   | BIT 8 OUT        | 17  | ENABLE (1-12)  |
| 6   | BIT 7 OUT        | 18  | COMP BIN       |
| 7   | BIT 6 OUT        | 19  | ANALOG INPUT   |

\* +5V power usage at 1 TTL logic loading per data output bit.

## TECHNICAL NOTES

- Applications which are unaffected by endpoint errors or remove them through software will use the typical connections shown in Figure 3. Remove system errors or adjust the small initial errors of the ADS-111 to zero using the optional external circuitry shown in Figure 4. The external adjustment circuit has no affect on the throughput rate.
- Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital

grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.

3. Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
4. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 18) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the COMP BIN pin to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To obtain three-state outputs, connect ENABLE (pin 17) to a logic "0" (low). Otherwise, connect ENABLE (pin 17) to a logic "1" (high).

**TIMING**

Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design

**Table 1. Input Range Selection**

| INPUT RANGE  | INPUT PIN | TIE TOGETHER     |
|--------------|-----------|------------------|
| $\pm 5$ V dc | Pin 19    | Pin 20 to Pin 21 |
| 0 to +10V dc | Pin 19    | Pin 20 to Ground |

**Table 2. Zero and Gain Adjust**

| FSR          | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>+FS - 1 1/2 LSB |
|--------------|-------------------------|--------------------------------|
| 0 to +10V dc | +1.22mV dc              | +9.9963V dc                    |
| $\pm 5$ V dc | +1.22mVdc               | +4.9963V dc                    |

**Table 3. Input Ranges  
(using external calibration)**

| INPUT RANGE              | R1 | R2 | UNIT   |
|--------------------------|----|----|--------|
| 0 to +10V, $\pm 5$ V     | 2  | 2  | K Ohms |
| 0 to +5V, $\pm 2.5$ V    | 2  | 6  | K Ohms |
| 0 to +2.5V, $\pm 1.25$ V | 2  | 14 | K Ohms |

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 3, Figure 4, and Table 1 for the appropriate full-scale range (FSR). Apply a pulse of 200 nanoseconds minimum to the START CONVERT input (pin 16) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

**2. Zero Adjustments**

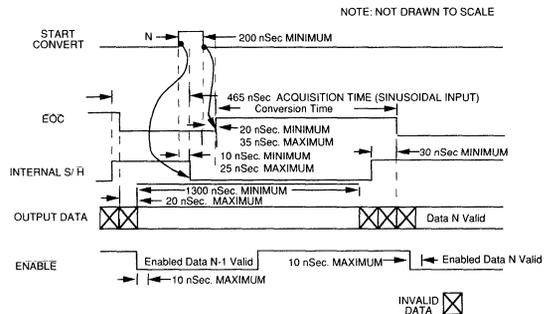

Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 2. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 18) tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with pin 18 tied low (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with (pin 18) tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with (pin 18) tied low (complementary offset binary).

**3. Full-Scale Adjustment**

Set the output of the voltage reference used in step 2 to the value shown in Table 2. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for (pin 18) tied high or between 0000 0000 0001 and 0000 0000 0000 for (pin 18) tied low.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

**Figure 2. ADS-111 Timing Diagram**

ACCESSORY

ADS-EVAL1 Evaluation Board (without ADS-111)  
 Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 1.0 MHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 1.3 Watts
- Three-state output buffers
- Samples to Nyquist
- No missing codes

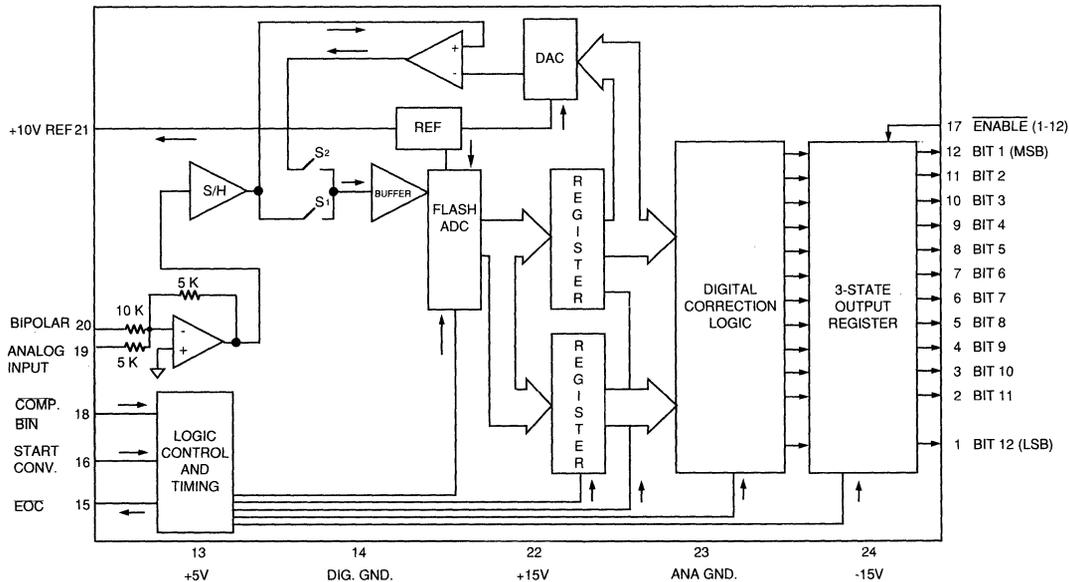

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION       |
|-----|------------------|-----|----------------|
| 1   | BIT 12 OUT (LSB) | 13  | +5V            |
| 2   | BIT 11 OUT       | 14  | DIGITAL GROUND |
| 3   | BIT 10 OUT       | 15  | EOC            |
| 4   | BIT 9 OUT        | 16  | START CONVERT  |
| 5   | BIT 8 OUT        | 17  | ENABLE (1-12)  |
| 6   | BIT 7 OUT        | 18  | COMP BIN       |
| 7   | BIT 6 OUT        | 19  | ANALOG INPUT   |
| 8   | BIT 5 OUT        | 20  | BIPOLAR        |
| 9   | BIT 4 OUT        | 21  | +10V REF       |
| 10  | BIT 3 OUT        | 22  | +15V           |
| 11  | BIT 2 OUT        | 23  | ANALOG GROUND  |
| 12  | BIT 1 OUT (MSB)  | 24  | -15V           |

### GENERAL DESCRIPTION

DATEL's ADS-112 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a space-saving 24-pin ceramic DIP. A minimum throughput rate of 1.0 MHz is achieved while only dissipating 1.3 Watts. The ADS-112 digitizes signals up to Nyquist.

Typical applications include spectrum, transient, vibration and waveform analysis. This device is also ideally suited for radar, sonar, video digitization, medical instrumentation and high-speed data acquisition systems.

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                                 | LIMITS       | UNITS    |
|--|--------------|----------|
| +15V Supply (Pin 22)                       | 0 to +18     | Volts dc |
| -15V Supply (Pin 24)                       | 0 to -18     | Volts dc |
| +5V Supply (Pin 13)                        | -0.5 to +7.0 | Volts dc |
| <b>Digital Inputs</b><br>(Pins 16, 17, 18) | -0.3 to +6.0 | Volts dc |
| <b>Analog Input (Pin 19)</b>               | -15 to +15   | Volts dc |
| <b>Lead Temp. (10 Sec.)</b>                | 300 max      | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and +5V dc unless otherwise specified.

| ANALOG INPUTS   | MIN.                            | TYP.   | MAX.   | UNITS    |

① For ±12V, +5V operation, contact DATEL

② +5V power usage at 1 TTL logic loading per data output bit.

TECHNICAL NOTES

- Applications which are unaffected by endpoint errors or remove them through software will use the typical connections shown in Figure 3. Remove system errors or adjust the small initial errors of the ADS-112 to zero using the optional external circuitry shown in Figure 4. The external adjustment circuit has no effect on the throughput rate.
- Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital ground are connected internally. Avoid ground-related problems by connecting the digital and analog ground to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
- Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7µF, 25V tantalum electrolytic capacitor in parallel with a 0.1 µF ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
- Obtain straight binary/offset binary output coding by tying COMP BIN (pin 18) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie pin 18 to ground. The pin 18 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- To enable the three-state outputs, connect ENABLE (pin 17) to a logic "0" (low). To disable, connect pin 17 to a logic "1" (high).

TIMING

Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

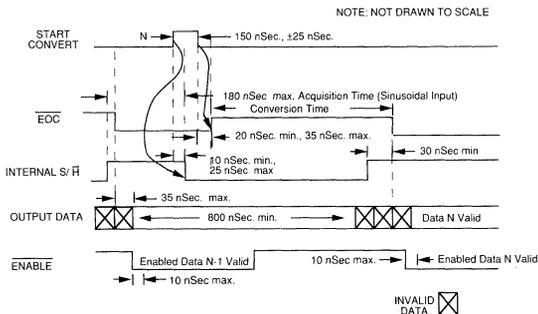

Figure 2. ADS-112 Timing Diagram

CALIBRATION PROCEDURE

- Connect the converter per Figure 3, Figure 4, and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 150 nanoseconds to the START CONVERT input (pin 16) at a rate of 250 KHz. This rate is chosen to reduce the flicker if LED's are used on the outputs for calibration purposes.
- Zero Adjustments  
Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with COMP BIN (pin 18) tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with pin 18 tied low (complementary binary).  
For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with pin 18 tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 18 tied low (complementary offset binary).
- Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for pin 18 tied high or between 0000 0000 0001 and 0000 0000 000 for pin 18 tied low.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 5.

Table 2. Input Range Selection

| INPUT RANGE  | INPUT PIN | TIE TOGETHER     |
|--------------|-----------|------------------|
| ±5V dc       | Pin 19    | Pin 20 to Pin 21 |
| 0 to +10V dc | Pin 19    | Pin 20 to Ground |

Table 3. Zero and Gain Adjust

| FSR          | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>+FS - 1 1/2 LSB |

**ORDERING INFORMATION**

| MODEL NUMBER | OPERATING TEMP. RANGE | SEAL     |
|--------------|-----------------------|----------|
| ADS-112MC    | 0 °C to +70 °C        | Hermetic |
| ADS-112MM    | -55 °C to +125 °C     | Hermetic |

**ACCESSORIES**

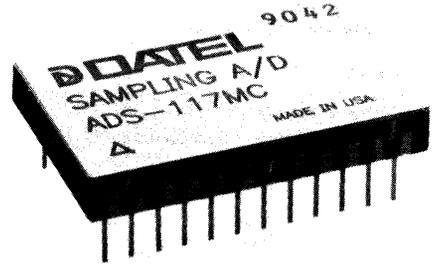

ADS-EVAL1 Evaluation board (without ADS-112)

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883B versions, contact DATEL.

#### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 2.0 MHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 1.4 Watts
- Three-state output buffers
- Samples to Nyquist

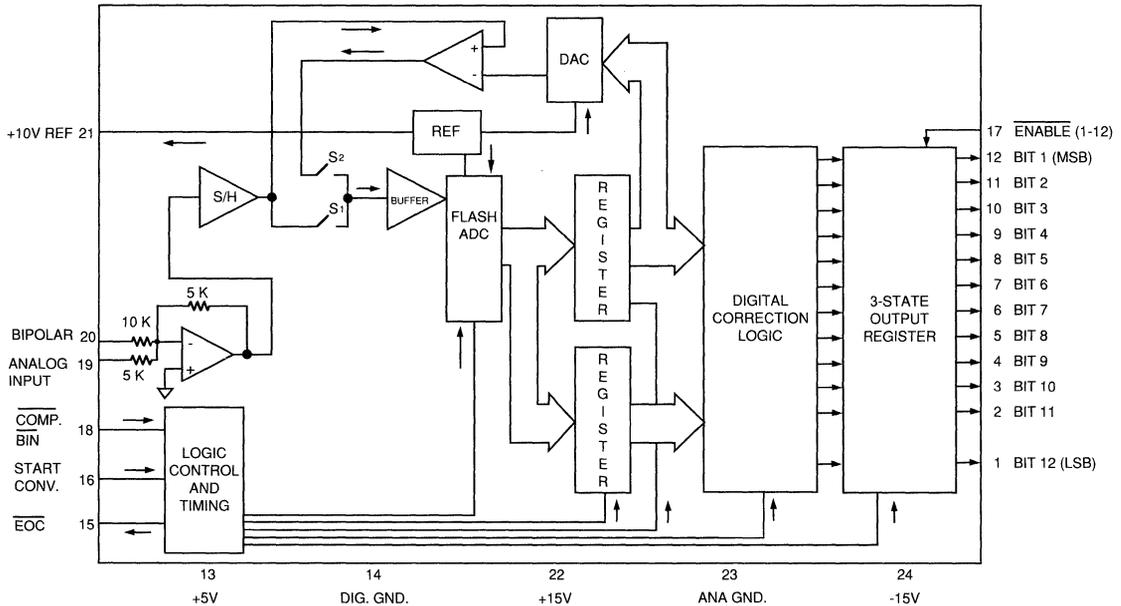

#### GENERAL DESCRIPTION

DATEL's ADS-117 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a space-saving 24-pin ceramic DIP. A minimum throughput rate of 2.0 MHz is achieved while only dissipating 1.4 Watts. The ADS-117 digitizes signals up to Nyquist.

#### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION       |
|-----|------------------|-----|----------------|
| 1   | BIT 12 OUT (LSB) | 13  | +5V            |
| 2   | BIT 11 OUT       | 14  | DIGITAL GROUND |
| 3   | BIT 10 OUT       | 15  | EOC            |
| 4   | BIT 9 OUT        | 16  | START CONVERT  |
| 5   | BIT 8 OUT        | 17  | ENABLE (1-12)  |
| 6   | BIT 7 OUT        | 18  | COMP BIN       |
| 7   | BIT 6 OUT        | 19  | ANALOG INPUT   |
| 8   | BIT 5 OUT        | 20  | BIPOLAR        |
| 9   | BIT 4 OUT        | 21  | +10V REF       |
| 10  | BIT 3 OUT        | 22  | +15V           |
| 11  | BIT 2 OUT        | 23  | ANALOG GROUND  |
| 12  | BIT 1 OUT (MSB)  | 24  | -15V           |

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                                 | LIMITS       | UNITS    |
|--|--------------|----------|
| +15V Supply (Pin 22)                       | 0 to +18     | Volts dc |
| -15V Supply (Pin 24)                       | 0 to -18     | Volts dc |
| +5V Supply (Pin 13)                        | -0.5 to +7.0 | Volts dc |
| <b>Digital Inputs</b><br>(Pins 16, 17, 18) | -0.3 to +6.0 | Volts dc |
| <b>Analog Input (Pin 19)</b>               | -15 to +15   | Volts dc |
| <b>Lead Temp. (10 Sec.)</b>                | 300 max      | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and +5V dc unless otherwise specified.

① For ±12V, +5V operation, contact DATEL  
 ② +5V power usage at 1 TTL logic loading per data output bit.

**TECHNICAL NOTES**

1. Applications which are unaffected by endpoint errors or remove them through software will use the typical connections shown in Figure 3. Remove system errors or adjust the small initial errors of the ADS-117 to zero using the optional external circuitry shown in Figure 4. The external adjustment circuit has no effect on the throughput rate.
2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
4. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 18) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie pin 18 to ground. The pin 18 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To enable the three-state outputs, connect ENABLE (pin 17) to a logic "0" (low). To disable, connect pin 17 to a logic "1" (high).
6. To meet the guaranteed conversion rate, a maximum start convert pulse is specified. A wider start convert pulse will result in slower conversion rates.

Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 3, Figure 4, and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 150 nanoseconds to the START CONVERT input (pin 16) at

a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

**2. Zero Adjustments**

Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 1. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the pin 18 tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with the pin 18 tied low (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with pin 18 tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 18 tied low (complementary offset binary).

**3. Full-Scale Adjustment**

Set the output of the voltage reference used in step 2 to the value shown in Table 1. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for pin 18 tied high or between 0000 0000 0001 and 0000 0000 0000 for pin 18 tied low.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

| MODEL NUMBER | OPERATING TEMP. RANGE              | SEAL     |
|--------------|------------------------------------|----------|
| ADS-117MC    | 0 °C to +70 °C                     | Hermetic |
| ADS-117MM    | -55 °C to +125 °C                  | Hermetic |
| ADS-EVAL1    | Evaluation board (without ADS-117) |          |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883 versions of the ADS-117, contact DATEL.

#### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 5.0 MHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 2.3 Watts
- Three-state output buffers
- Samples to Nyquist

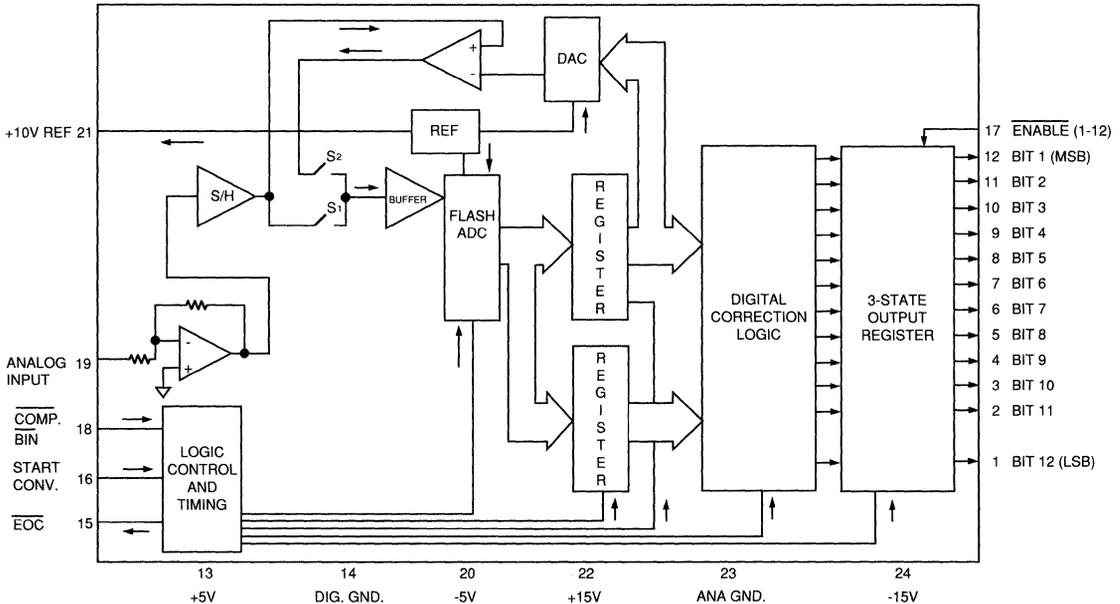

#### GENERAL DESCRIPTION

DATEL's ADS-118 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a space-saving 24-pin ceramic DIP. A minimum throughput rate of 5.0 MHz is achieved while only dissipating 2.3 Watts. The ADS-118 digitizes signals up to Nyquist.

#### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION       |
|-----|------------------|-----|----------------|
| 1   | BIT 12 OUT (LSB) | 13  | +5V            |
| 2   | BIT 11 OUT       | 14  | DIGITAL GROUND |
| 3   | BIT 10 OUT       | 15  | EOC            |
| 4   | BIT 9 OUT        | 16  | START CONVERT  |
| 5   | BIT 8 OUT        | 17  | ENABLE (1-12)  |
| 6   | BIT 7 OUT        | 18  | COMP BIN       |

① For ±12V, +5V operation, contact DATEL  
 ② +5V power usage at 1 TTL logic loading per data output bit.

TECHNICAL NOTES

1. Applications which are unaffected by endpoint errors or remove them through software will use the typical connections shown in Figure 3. Remove system errors or adjust the small initial errors of the ADS-118 to zero using the optional external circuitry shown in Figures 4a and 4b. The external adjustment circuit has no affect on-the throughput rate.
2. Rated performance requires using good-high-frequency circuit board layout techniques. The analog and digital grounds are connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
4. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 18) to +5V dc open. To obtain complementary binary or complementary offset binary output coding, tie pin 18 to ground. The pin 18 signal is compatible with CMOS/TTL logic levels for those users desiring logic control of this function.
5. To enable the three-state outputs, connect  $\overline{\text{ENABLE}}$  (pin 17) to a logic "0" (low). To disable, connect pin 17 to a logic "1" (high).
6. Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

CALIBRATION PROCEDURE

1. Connect the converter per Figure 3 and Figure 4 for the appropriate full-scale range (FSR). Apply a pulse of 45 nano-seconds to the START CONVERT input (pin 16) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments  
Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 1 for bipolar zero adjustment (zero +1/2 LSB).  
  
For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 18) tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with COMP BIN (pin 18) tied low (complementary offset binary).
3. Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 1 for the bipolar gain adjustment (+FS -1 1/2 LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for COMP BIN (pin 18) tied high or between 0000 0000 0001 and 0000 0000 0000 for COMP BIN (pin 18) tied low.
4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 2.

**ORDERING INFORMATION**

| MODEL NUMBER | OPERATING TEMP. RANGE              | SEAL     |
|--------------|------------------------------------|----------|
| ADS-118MC    | 0 °C to +70 °C                     | Hermetic |
| ADS-118MM    | -55 °C to +125 °C                  | Hermetic |
| ADS-EVAL2    | Evaluation Board (without ADS-118) |          |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883 versions of the ADS-118, contact DATEL.

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold amplifier
- 20 MHz minimum throughput
- Samples up to Nyquist
- Functionally Complete
- Small 40-pin DIP
- Low-power, 4.2 Watts
- Three-State output buffers
- High input bandwidth
- Overflow pin

### GENERAL DESCRIPTION

DATEL's ADS-120 is a 12-bit, functionally complete, sampling A/D converter packaged in a small 40-pin DIP. A 20 MHz minimum throughput rate in digitizing sinusoidal signals is achieved while only dissipating 4.2 Watts.

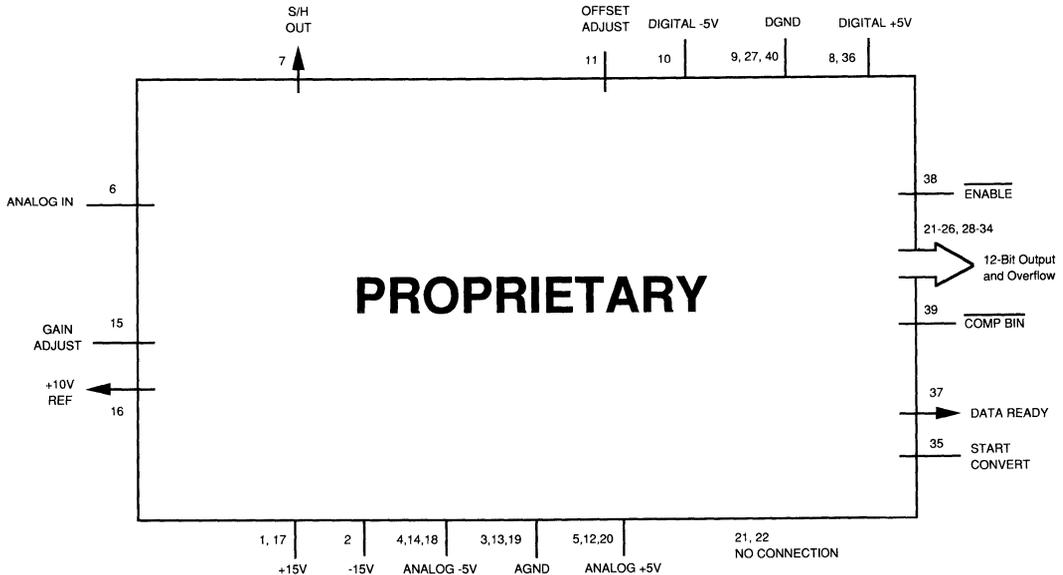

The ADS-120 is offered in the commercial 0 to +70 °C and military -55 to +125 °C operating temperature range.

### APPLICATIONS

- Spectrum analysis
- Imaging
- Radar
- Medical Instrumentation
- High-speed Data Acquisition Systems

① +5V power usage at 1 TTL logic loading per data output bit.  
② The same specifications apply to Inband Harmonics.

**TECHNICAL NOTES**

1. Use external potentiometers to remove system errors or to reduce the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 15 (tie pin 15 to ANALOG GROUND for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 11 for zero/offset adjustment (tie pin 11 to ANALOG GROUND for operation without adjustment).

2. Rated performance requires using good high-frequency circuit board layout techniques. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter.

In most cases, users will use a single +5V supply for both analog +5V and digital +5V (applicable for the -5V supply also). Should users have separate supplies the difference between the analog and digital supply should be within  $\pm 100$  mV to avoid performance degradation.

Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies. This prevents contamination of the analog ground by noisy digital ground currents.

3. Bypass all the analog and digital power supply pins with a 2.2  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor to their respective analog and digital grounds. Use of chip capacitors is recommended.

4. Obtain offset binary output coding by tying  $\overline{\text{COMP BIN}}$  (pin 39) to +5V dc. To obtain complementary offset binary output coding, tie pin 39 to ground. The pin 39 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.

5. To obtain three-state outputs, connect the  $\overline{\text{ENABLE}}$  pin (pin 38) to a logic "1" (high). Otherwise, connect pin 38 to a logic "0" (low).

6. The ADS-130 guarantees its specified throughput rate over the temperature range when the START CONVERT pulse of 10 nS minimum, 90 nS maximum is provided at the specified rate. Start convert pulses greater than 90 nanoseconds will result in slower throughput rates.

7. The ADS-130 is capable of digitizing sinusoidal input frequencies up to the Nyquist frequency. The acquisition time for pulse or dc level signals is 50 nS maximum over the 0 to +70 °C temperature range. Acquisition time is 70 nSec. maximum from -55 °C to +125 °C.

8. The specifications listed in Figure 2 (timing diagram) apply over the full operating temperature range unless otherwise specified.

9. The OVERFLOW pin goes high for signals greater than +full scale (no overflow flag given for signals greater than -FS). The OVERFLOW pin is a three-state output and is enabled by pin 38.

10. The ADS-130 has a one pipeline delay in obtaining output data. Refer to the Timing Diagram in Figure 3.

11. The ADS-130 goes into the hold mode on the rising edge of the start convert pulse.

**CALIBRATION PROCEDURE**

**1. Connect the converter per Figure 2.**

Apply a pulse of 10 nS typical to the START CONVERT input (pin 35) at a rate of 500 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

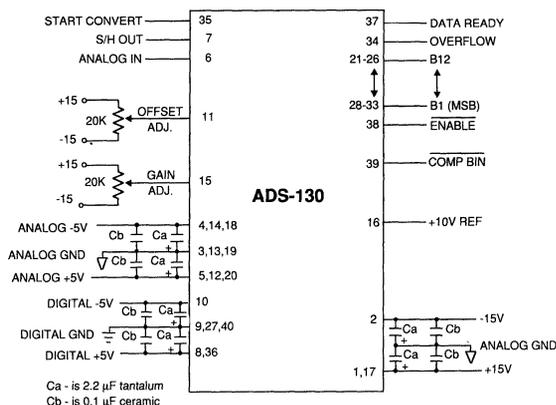

**2. Zero Adjustments**

Apply a precision voltage reference source between the analog input (pin 6) and analog ground. Adjust the output of the reference source per Table 2 for the bipolar zero adjustment (zero +1/2 LSB). Adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 39) tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 39 tied low (complementary offset binary).

**3. Full-Scale Adjustment**

Set the output of the voltage reference used in step 2 to the value shown in Table 2 for the bipolar gain adjustment (+FS -1 1/2 LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 with pin 39 tied high or between 0000 0000 0000 and 0000 0000 0001 with pin 39 tied low.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

For availability of MIL-STD-883B versions, contact DATEL.

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold amplifier
- 5.0 MHz minimum throughput
- Samples up to Nyquist
- Functionally Complete
- Small 40-pin DIP
- Low-power, 3.65 Watts
- Three-State output buffers
- High input bandwidth
- Overflow pin
- No missing codes

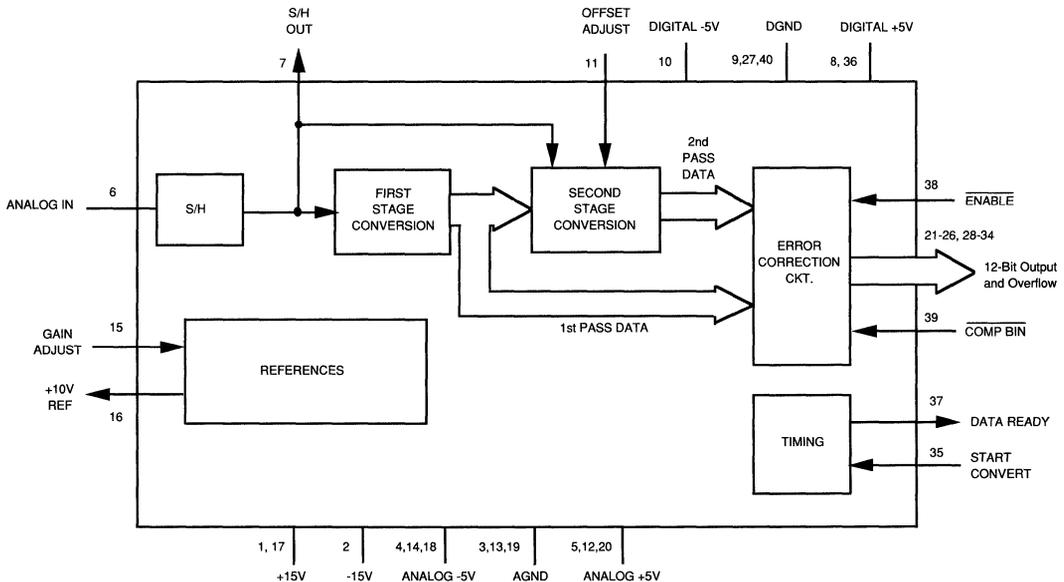

### INPUT/OUTPUT CONNECTIONS

### GENERAL DESCRIPTION

DATEL's ADS-131 is a 12-bit, functionally complete, sampling A/D converter packaged in a small 40-pin DIP. A 5.0 MHz minimum throughput rate in digitizing sinusoidal signals is achieved while only dissipating 3.65 Watts.

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                        | LIMITS       | UNITS    |
|-----------------------------------|--------------|----------|
| +15V Supply (Pin 1,17)            | 0 to +18     | Volts dc |
| -15V Supply (Pin 2)               | 0 to -18     | Volts dc |
| +5V Supply (Pin 5, 8,12,20,36)    | -0.5 to +7.0 | Volts dc |
| -5V Supply (Pin 4,10,14,18)       | +0.5 to -7.0 | Volts dc |
| Digital Inputs<br>(Pins 35,38,39) | -0.3 to +5.5 | Volts dc |
| Analog Input (Pin 6)              | ±5           | Volts dc |
| Lead Temp.(10 Sec.)               | 300          | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and ±5V dc unless otherwise specified.

① +5V power usage at 1 TTL logic loading per data output bit.  
② The same specifications apply to Inband Harmonics.

TECHNICAL NOTES

1. Use external potentiometers to remove system errors or to reduce the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 15 (tie pin 15 to ANALOG GROUND for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 11 for zero/offset adjustment (tie pin 11 to ANALOG GROUND for operation without adjustment).

2. Rated performance requires using good high-frequency circuit board layout techniques. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter.

In most cases, users will use a single +5V supply for both analog +5V and digital +5V (applicable for the -5V supply also). Should users have separate supplies the difference between the analog and digital supply should be within  $\pm 100$  mV to avoid performance degradation.

Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies. This prevents contamination of the analog ground by noisy digital ground currents.

3. Bypass all the analog and digital power supply pins with a 2.2  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor to their respective analog and digital grounds. Use of chip capacitors is recommended.

4. Obtain offset binary output coding by tying COMP BIN (pin 39) to +5V dc. To obtain complementary offset binary output coding, tie pin 39 to ground. The pin 39 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.

5. To obtain three-state outputs, connect ENABLE (pin 38) to a logic "1" (high). Otherwise, connect pin 38 to a logic "0" (low).

6. The ADS-131 guarantees it's specified throughput rate over the temperature range when the START CONVERT pulse of 10 nS minimum, 190 nS maximum is provided at the specified rate. Start convert pulses greater than 190 nano-seconds will result in slower throughput rates.

7. The ADS-131 is capable of digitizing sinusoidal input frequencies up to the Nyquist frequency. The acquisition time for pulse or dc level signals is 70 nS maximum over the 0 to +70 °C temperature range. Acquisition time is 100 nSec. maximum from -55 °C to +125 °C.

8. The specifications listed in Figure 3 (timing diagram) apply over the full operating temperature range unless otherwise specified.

9. The OVERFLOW pin goes high for signals greater than +full scale (no overflow flag given for signals greater than -FS). The OVERFLOW pin is a three-state output and is enabled by the ENABLE line (pin 38).

10. The ADS-131 has a one pipeline delay in obtaining output data. Refer to the Timing Diagram in Figure 3.

11. ADS-131 goes into the hold mode on the rising edge of the start convert pulse.

CALIBRATION PROCEDURE

1. Connect the converter per Figure 2.

Apply a pulse of 10 nS typical to the START CONVERT input (pin 35) at a rate of 500 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

2. Zero Adjustments

Apply a precision voltage reference source between the analog input (pin 6) and analog ground. Adjust the output of the reference source per Table 2 for the bipolar zero adjustment (zero +1/2 LSB). Adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 39 tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 39 tied low (complementary offset binary).

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2 for the bipolar gain adjustment (+FS -1 1/2 LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 with COMP BIN (pin 39) tied high or between 0000 0000 0000 and 0000 0000 0001 with pin 39 tied low.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

| ADS-B130/131 | Evaluation Board (without ADS-131)  |          |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

For availability of MIL-STD-883B versions, contact DATEL.

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 2.0 MHz minimum throughput
- Functionally complete
- Small 32-pin DIP
- Low-power, 2.9 Watts
- Three-state output buffers
- Samples up to Nyquist
- No -5V supply required

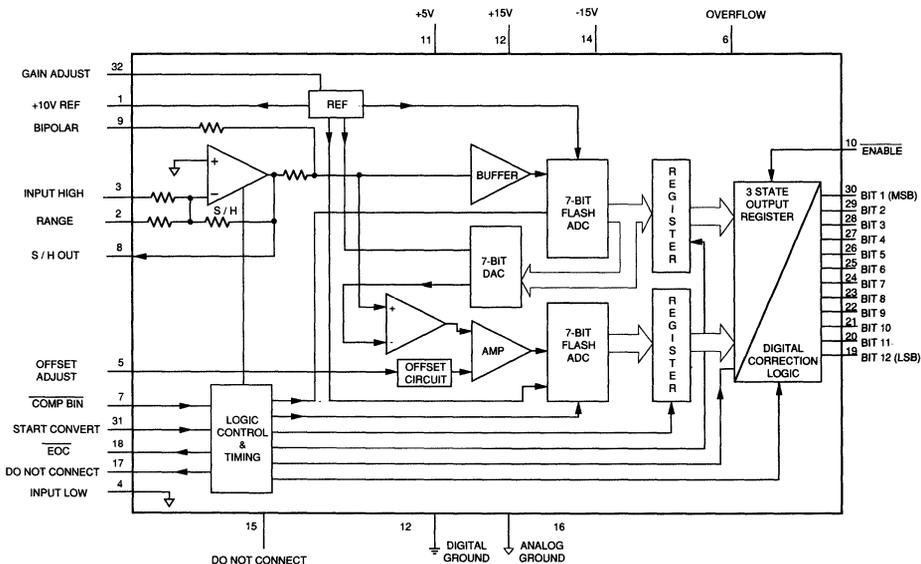

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION        | PIN | FUNCTION         |
|-----|-----------------|-----|------------------|
| 1   | +10V REF. OUT   | 17  | DO NOT CONNECT   |
| 2   | RANGE           | 18  | EOC              |
| 3   | INPUT HIGH      | 19  | BIT 12 OUT (LSB) |
| 4   | INPUT LOW       | 20  | BIT 11 OUT       |
| 5   | OFFSET ADJUST   | 21  | BIT 10 OUT       |
| 6   | OVERFLOW        | 22  | BIT 9 OUT        |
| 7   | COMP. BIN       | 23  | BIT 8 OUT        |
| 8   | S/H OUT         | 24  | BIT 7 OUT        |
| 9   | BIPOLAR         | 25  | BIT 6 OUT        |
| 10  | ENABLE (1 - 12) | 26  | BIT 5 OUT        |
| 11  | +5              | 27  | BIT 4 OUT        |
| 12  | DIGITAL GROUND  | 28  | BIT 3 OUT        |
| 13  | +15V            | 29  | BIT 2 OUT        |
| 14  | -15V            | 30  | BIT 1 OUT (MSB)  |
| 15  | DO NOT CONNECT  | 31  | START CONVERT    |
| 16  | ANALOG GROUND   | 32  | GAIN ADJUST      |

### GENERAL DESCRIPTION

DATEL's ADS-132 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a small 32-pin ceramic DIP. The ADS-132 digitizes sinusoidal signals at a 2.0 MHz minimum throughput rate while dissipating only 2.9 Watts.

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                                | LIMITS       | UNITS    |
|---|--------------|----------|
| +15V Supply (Pin 13)                      | 0 to +18     | Volts dc |
| -15V Supply (Pin 14)                      | 0 to -18     | Volts dc |
| +5V Supply (Pin 11)                       | -0.5 to +7.0 | Volts dc |
| <b>Digital Inputs</b><br>(Pins 7, 10, 31) | -0.3 to +6.0 | Volts dc |
| <b>Analog Input (Pin 3)</b>               | -15 to +15   | Volts dc |
| <b>Lead Temp. (10 Sec.)</b>               | 300 max      | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at 15±V dc and +5V dc unless otherwise specified.

| ANALOG INPUTS   | MIN.                            | TYP.     | MAX.  | UNITS    |

① +5V power usage at 1 TTL logic loading per data output bit. Specifications subject to change without notice.

**TECHNICAL NOTES**

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 32 (ground pin 32 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (leave pin 5 open for operation without adjustment). See Figure 3.
2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 16).
4. To enable the three-state outputs, connect  $\overline{\text{ENABLE}}$  (pin 10) to a logic "0" (low). To disable, connect  $\overline{\text{ENABLE}}$  (pin 10) to a logic "1" (high).
5. The ADS-132 is in the sample mode when the internal S/H CONTROL pin is high (S/H is in the high-state on power-up). The START CONVERT pulse should be given at a time delay equal to the desired acquisition time minus the 10 nanosecond delay from START CONVERT high to S/H CONTROL low. This assures the sample-hold has the minimum required acquisition time for the particular application mode.
6. Upon going into the hold mode there will be a 85 nanosecond maximum delay before EOC goes high and the A/D conversion begins. This consists for the remaining 50 nanoseconds of the START CONVERT (10 nanoseconds is part of the acquisition time) and a 20 nanosecond maximum delay from START CONVERT low to EOC high. The hold mode settling time requirement is met during this time.
7. Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 3, and Tables 1 and 4 for the appropriate full-scale range (FSR). Apply a pulse of 60 nanoseconds minimum to the START CONVERT input (pin 31) at a rate of 500 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments  
Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 2. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 (straight binary) or between 1111 1111 1111 and 1111 1111 1110 (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 (offset binary) or between 0111 1111 1111 and 0111 1111 1110 (complementary offset binary).

3. Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 2. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 (offset binary) or between 0000 0000 0001 and 0000 0000 0000 (complementary offset binary).
4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

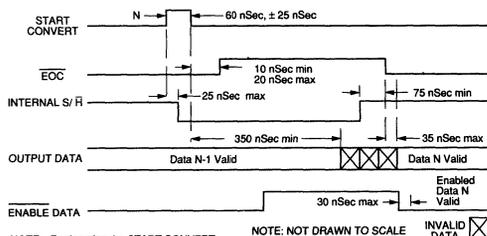

**Table 1. ADS-132 Input Range Selection**

| INPUT RANGE   | INPUT PIN | TIE TOGETHER                                  |
|---------------|-----------|---|
| 0 to -5V dc   | Pin 3     | Pin 8 to Pin 9, Pin 2 to Pin 3                |

MECHANICAL DIMENSIONS INCHES (MM)

NOTE: Pins have 0.025 Inch ±0.01 standoff from case.

ORDERING INFORMATION

| MODEL NUMBER | OPERATING TEMP. RANGE | SEAL     |
|--------------|-----------------------|----------|
| ADS-132MC    | 0 °C to +70 °C        | Hermetic |
| ADS-132MM    | -55 °C to +125 °C     | Hermetic |

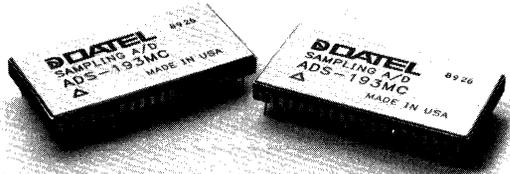

Receptacle for PC board mounting can be ordered through AMP Inc., Part #3-331272-8 (Component Lead Socket), 24 required.

ADS-EVAL1 Evaluation Board (without ADS-132)

For availability of MIL-STD-883 versions, contact DATEL.

### FEATURES

- 12-Bit resolution
- Internal Sample/Hold
- 1.0 MHz minimum throughput
- Functionally complete
- Low-power, 1.3 Watts
- Samples to Nyquist

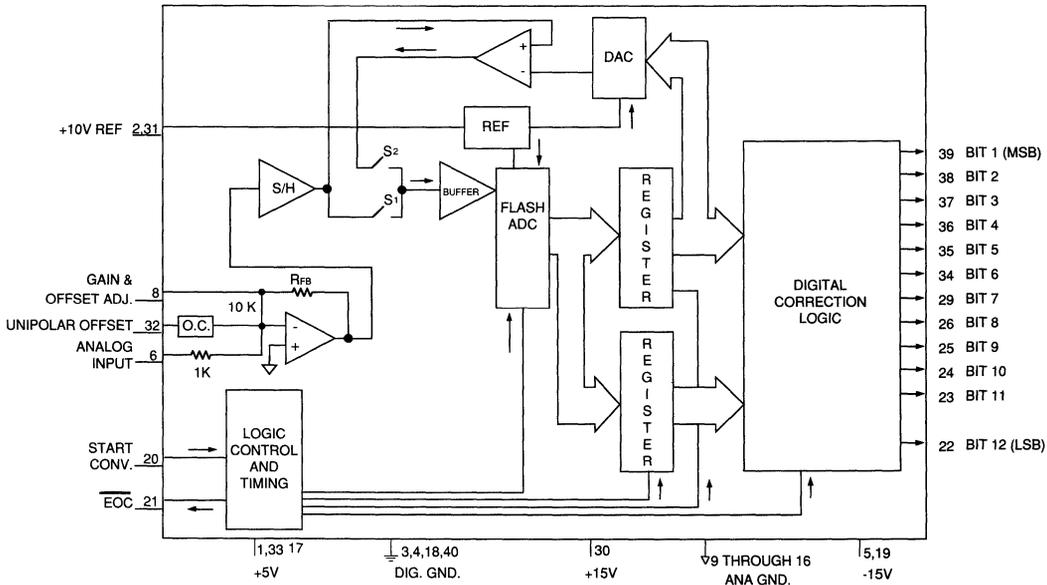

### GENERAL DESCRIPTION

DATEL's ADS-193 is a 12-bit, functionally complete, sampling A/D converter that is packaged in a 40-pin ceramic DIP. A minimum throughput rate of 1.0 MHz is achieved while only dissipating 1.3 Watts. The ADS-193 digitizes signals up to Nyquist.

Typical applications include spectrum, transient, vibration and waveform analysis. This device is also ideally suited for radar, sonar, video digitization, medical instrumentation and high-speed data acquisition systems. For information on high reliability screening, contact DATEL.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION         |

① +5V power usage at 1 TTL logic loading per data output bit. Specifications subject to change without notice.

TECHNICAL NOTES

1. Use external potentiometers as shown in Figure 3 to adjust the offset and gain errors to zero. For operation without adjustment, leave pin 8 open.
  2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are connected internally. Avoid ground-related problems by connecting the digital analog grounds to one point, the ground plane beneath the converter.
- Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies to ground with a 10  $\mu$ F, 25V tantalum electrolytic capacitor. Bypass the +10V reference (pin 2 and 31) to analog ground (pin 16) with a 0.1  $\mu$ F ceramic capacitor.
  4. For unipolar, 0 to -5V FSR, connect pins 31 and 32. For bipolar,  $\pm 2.5$ V FSR, connect pin 32 to analog ground and connect pin 31 to a 0.1  $\mu$ F ceramic capacitor only.
  5. Pins 27 and 28 are no connection pins. Connecting pins 27 and 28 together is acceptable.

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001.

3. Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 2. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111.
4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

| 0 to -5V dc<br>$\pm 2.5$ V dc | -0.61mV dc<br>+0.61 mV   | -4.9982V<br>-2.4982V           |

TIMING

Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

CALIBRATION PROCEDURE

1. Connect the converter per Figure 3 for the appropriate full-scale range (FSR). Apply a pulse of 200 nanoseconds minimum to the START CONVERT input (pin 20) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments  
Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 2. Adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 for unipolar.

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

For availability of MIL-STD-883 versions, contact DATEL.

### FEATURES

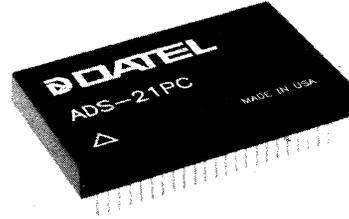

- 12-Bit resolution
- 1.3 MHz throughput rate
- S/H included
- Single 46-pin DIP

### GENERAL DESCRIPTION

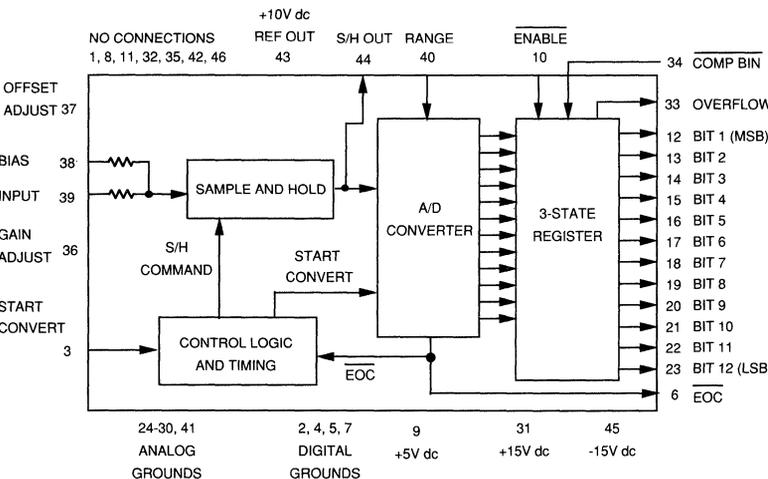

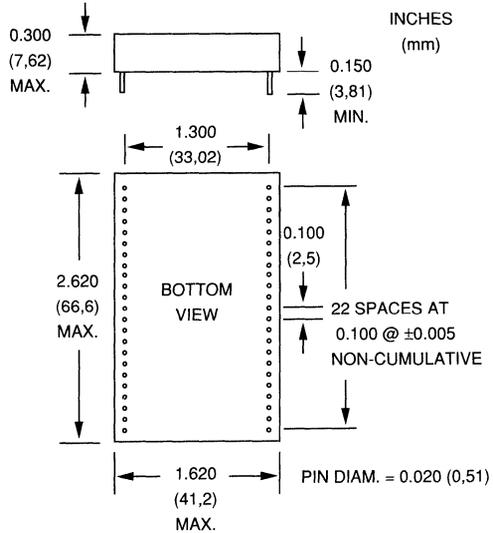

DATEL's ADS-21PC Sampling Converter combines a 12-bit A/D and a S/H in one space-saving package. Designed and manufactured at DATEL's modern, certified hybrid assembly facility using state-of-the-art integrated circuits, the ADS-21PC provides the highest quality and performance for signal processing applications.

### TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 36 (ground pin 36 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 37 for zero/offset adjustment (leave pin 37 open for operation without adjustment).
2. Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies. This prevents contamination of the analog ground by noisy digital ground currents.

\*+5V power usage at 1 TTL logic loading per data output bit.

① Same specification values apply for Total Harmonic Distortion (-0.5 dB below FS).

**TECHNICAL NOTES CONT.**

- Bypass all the analog and digital supplies and the +10V reference (pin 43) to ground with a 4.7 μF, 25V tantalum electrolytic capacitor in parallel with a 0.1 μF ceramic capacitor. Bypass the +10V reference (pin 43) to analog ground (pin 41).
- The  $\overline{\text{COMP BIN}}$  input (pin 34) allows selection of binary/offset binary or complementary binary/complementary offset binary. Refer to Table 3 for the desired coding selection. Pin 34 has an internal pull-up resistor and is TTL-compatible for those users desiring logic control of this function.
- The internal  $\overline{\text{Sample/Hold}}$  control signal goes low following the rising edge of a  $\overline{\text{start}}$  convert pulse and high 65 nanoseconds minimum before EOC goes low. This S/H low signal indicates that the converter can accept a new analog input.

Table 1. Input Connections

| Input Voltage Range | Connect Input Pin 38 to | Connect Pin 40 (Range) to |
|---------------------|-------------------------|---------------------------|
| 0 to -5V            | 39                      | 44                        |
| 0 to -10V           | —                       | 44                        |
| 0 to +10V           | Ext. -10V Ref.*         | 44                        |

| ±10V                | —                       | 43                        |

\*May be referenced to +10V Ref. (Pin 43)

Table 2. Zero and Gain Adjust

| FSR       | Zero Adjust +1/2 LSB | Gain Adjust +FS - 1 1/2 LSB |
|-----------|----------------------|-----------------------------|
| 0 to -5V  | -0.61 mV             | -4.9982V                    |
| 0 to -10V | -1.22 mV             | -9.9963V                    |
| 0 to +10V | +1.22 mV             | +9.9963V                    |
| ±10V dc   | +2.44 mV             | +9.9927V dc                 |
| ±5V dc    | +1.22 mV             | +4.9963V dc                 |

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 3 and Tables 1 and 3 for the appropriate full-scale range (FSR) and coding options. Apply a pulse of 100 nanoseconds minimum to the START CONVERT input (pin 3) at a rate of 500 KHz. This rate chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

2. Zero Adjustment

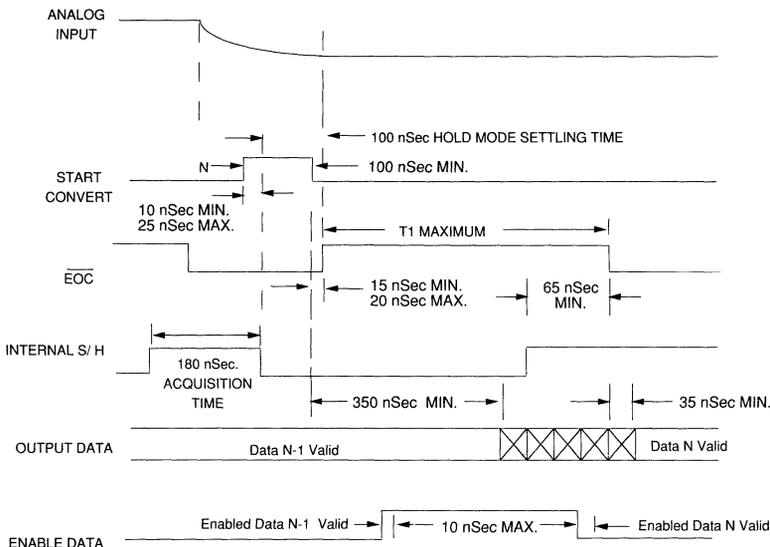

Apply a precision voltage reference source between the analog input (pin 39) and ground (pin 24). Adjust the output of the reference source per Table 2. For Unipolar operation adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 or between 1111 1111 1111 and 1111 1111 1110. Refer to Table 4.

For bipolar operation, adjust the potentiometer until the displayed code flickers equally between 1000 0000 0000 and 1000 0000 0001 or between 0111 1111 1111 and 0111 1111 1110. Refer to Table 5.

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 or between 0000 0000 0001 and 0000 0000 0000 depending on the output coding selected.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Tables 4 and 5.

T1 Values

| Conversion Time | Temperature |             |
|-----------------|-------------|-------------|
|                 | +25 °C      | 0 to +70 °C |
|                 | 530 nSec.   | 590 nSec.   |

**NOTE:** Timing cited is guaranteed by design and applies over the operating temperature and power supply ranges.

NOTE: NOT DRAWN TO SCALE

**NOTES:**

1. Pins 2, 4, 5, 7, 24-30, and 41 must be connected to the ground plane as close as possible to the case.
2. Pins 1, 8, 11, 32, 35, 42, and 46 have no internal connections.

#### FEATURES

- 14-Bit resolution
- Internal Sample/Hold
- 300 KHz minimum throughput
- Functionally complete
- Small 24-pin DIP
- Low-power, 1.4 Watts
- Three-state output buffers

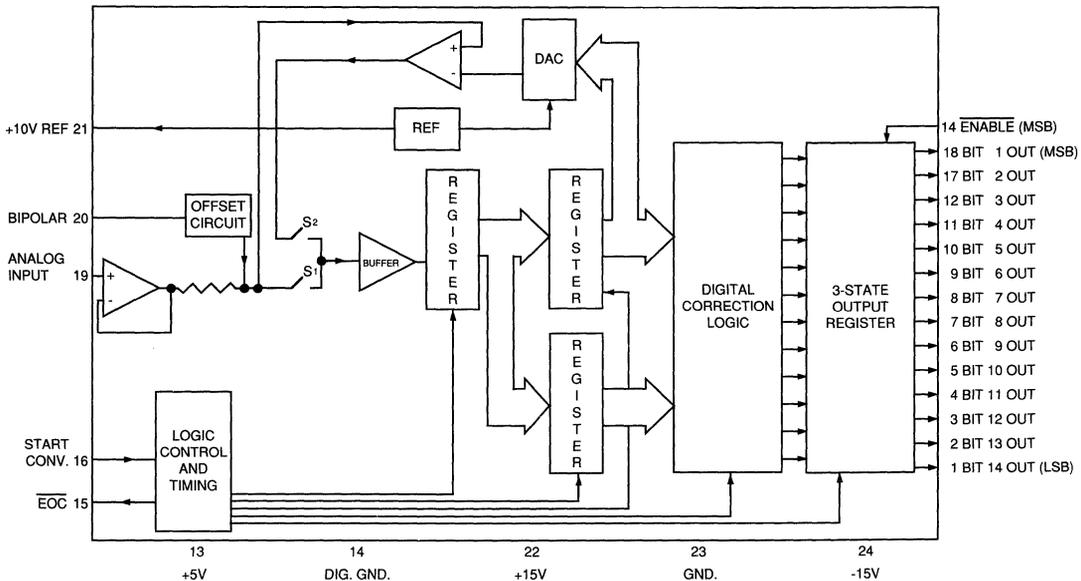

#### GENERAL DESCRIPTION

DATEL's ADS-924 is a 14-bit, functionally complete, sampling A/D converter that is packaged in a space-saving 24-pin ceramic DIP. A minimum throughput rate of 300 KHz is achieved while only dissipating 1.4 Watts.

#### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION      |
|-----|------------------|-----|---------------|
| 1   | BIT 14 OUT (LSB) | 13  | +5V           |
| 2   | BIT 13 OUT       | 14  | ENABLE        |
| 3   | BIT 12 OUT       | 15  | EOC           |
| 4   | BIT 11 OUT       | 16  | START CONVERT |
| 5   | BIT 10 OUT       | 17  | BIT 2 OUT     |
| 6   | BIT 9 OUT        | 18  | BIT 1 (MSB)   |
| 7   | BIT 8 OUT        | 19  | ANALOG INPUT  |
| 8   | BIT 7 OUT        | 20  | BIPOLAR       |
| 9   | BIT 6 OUT        | 21  | +10V REF      |
| 10  | BIT 5 OUT        | 22  | +15V          |
| 11  | BIT 4 OUT        | 23  | GROUND        |
| 12  | BIT 3 OUT        | 24  | -15V          |

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                             | LIMITS       | UNITS    |
|--|--------------|----------|
| +15V Supply (Pin 22)                   | 0 to +18     | Volts dc |
| -15V Supply (Pin 24)                   | 0 to -18     | Volts dc |
| +5V Supply (Pin 13)                    | -0.5 to +7.0 | Volts dc |
| <b>Digital Inputs</b><br>(Pins 14, 16) | -0.3 to +6.0 | Volts dc |
| <b>Analog Input (Pin 19)</b>           | -15 to +15   | Volts dc |
| <b>Lead Temp.(10 Sec.)</b>             | 300 max      | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and +5V dc unless otherwise specified.

\* +5V power usage at 1 TTL logic loading per data output bit.

**TECHNICAL NOTES**

- Applications which are unaffected by endpoint errors or remove them through software will use the typical connections shown in Figure 3. Remove system errors or adjust the small initial errors of the ADS-924 to zero using the optional external circuitry shown in Figure 4. The external adjustment circuit has no effect on the throughput rate.
- Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
- The ADS-924 exhibits up to 2.0 LSB's of peak-to-peak noise. Digital signal processing (DSP) applications will average this noise.
- To obtain three-state outputs, connect **ENABLE** (pin 14) to a logic "0" (low). Otherwise, connect **ENABLE** (pin 14) to a logic "1" (high).

**TIMING**

Figure 2 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**Figure 2. ADS-924 Timing Diagram**

**Table 2. Input Range Selection**

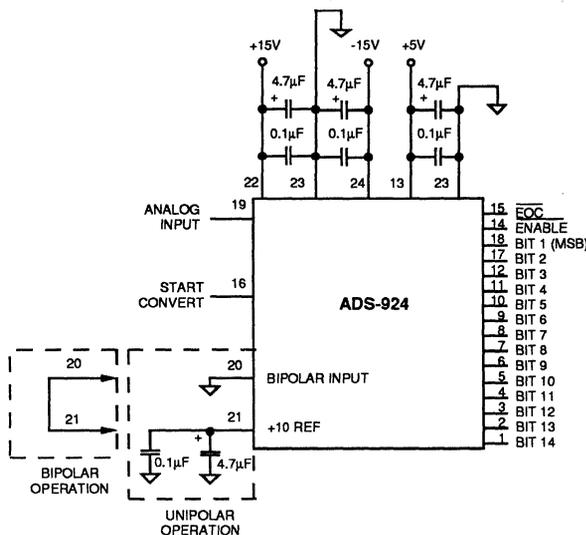

| INPUT RANGE  | INPUT PIN | TIE TOGETHER     |
|--------------|-----------|------------------|
| $\pm 5V$ dc  | Pin 19    | Pin 20 to Pin 21 |
| 0 to +10V dc | Pin 19    | Pin 20 to Ground |

**Table 3. Zero and Gain Adjust**

| FSR          | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>+FS - 1 1/2 LSB |
|--------------|-------------------------|--------------------------------|
| 0 to +10V dc | +300 $\mu$ V dc         | +9.9991V dc                    |
| $\pm 5V$ dc  | +300 $\mu$ V dc         | +4.9991V dc                    |

**Table 4. Input Ranges  
(using external calibration)**

| INPUT RANGE             | R1   | R2   | UNIT   |
|-------------------------|------|------|--------|
| 0 to +10V, $\pm 5V$     | 2    | 2    | K Ohms |
| 0 to +5V, $\pm 2.5V$    | 1.65 | 4.99 | K Ohms |
| 0 to +2.5V, $\pm 1.25V$ | 715  | 4990 | K Ohms |

**Figure 3. Typical Input Connections for the ADS-924**

**CALIBRATION PROCEDURE**

- Connect the converter per Figure 3, Figure 4, and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 200 nanoseconds minimum to the **START CONVERT** input (pin 16) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
- Zero Adjustments**  
Apply a precision voltage reference source between the amplifier's analog input and ground. Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 00 0000 0000 0000 and 00 0000 0000 0001.

For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001.

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 11 1111 1111 1110 and 11 1111 1111 1111.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 5.

Figure 4. Optional Calibration Circuit

ORDERING INFORMATION

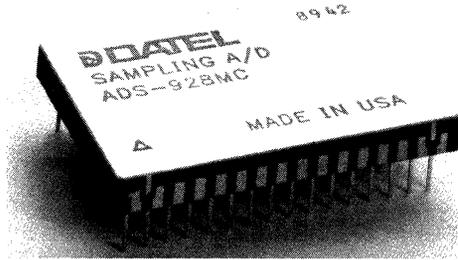

| MODEL NUMBER | OPERATING TEMP. RANGE | SEAL     |
|--------------|-----------------------|----------|
| ADS-924MC    | 0 °C to +70 °C        | Hermetic |
| ADS-924MM    | -55 °C to +125 °C     | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883B versions, contact DATTEL.

### FEATURES

- 14-Bit resolution
- 500 KHz sampling rate
- Functionally complete
- Small 32-pin DIP
- Low-power, 3.1 Watts
- Three-state output buffers
- Samples up to Nyquist

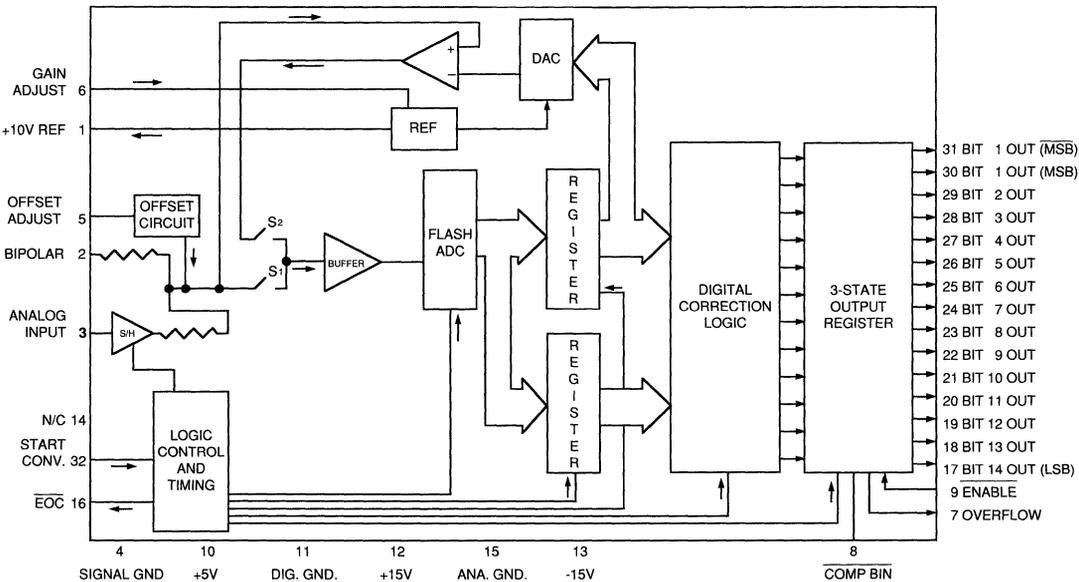

### GENERAL DESCRIPTION

DATEL's ADS-928 is a 14-bit, 500 KHz sampling rate, functionally complete A/D converter. The ADS-928 samples up to Nyquist with no missing codes.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with 3.1 Watts power dissipation.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION       | PIN | FUNCTION         |

① +5V power usage at 1 TTL logic loading per data output bit.

TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 6 (ground pin 6 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (connect pin 5 to pin 15, analog ground for operation without adjustment).
2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 15).
4. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 8) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the COMP BIN pin to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To enable the three-state outputs, connect ENABLE (pin 9) to a logic "0" (low). To disable, connect ENABLE (pin 9) to a logic "1" (high).
6. The 200 nSec. minimum START CONVERT pulse width assures the hold mode settling time requirements are met.
7. The specifications listed in Figure 2 (timing diagram) apply over the full operating temperature range unless otherwise specified.

2. Zero Adjustments

Apply a precision voltage reference source between the analog input (pin 3) and signal ground (pin 4). Adjust the output of the reference source per Table 2.

For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 00 0000 0000 and 00 0000 0000 0001 with the COMP BIN (pin 8) tied high (straight binary) or between 11 1111 1111 1111 and 11 1111 1111 1110 with the COMP BIN (pin 8) tied low (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001 with COMP BIN (pin 8) tied high (offset binary) or between 01 1111 1111 1111 and 01 1111 1111 1110 with COMP BIN (pin 8) tied low (complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with COMP BIN (pin 8) tied high, adjusting the potentiometer such that the code flickers between 00 0000 0000 0000 and 00 0000 0000 0001.

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2.

Adjust the gain trimming potentiometer so that the output code flickers equally between 11 1111 1111 1110 and 11 1111 1111 1111 for COMP BIN (pin 8) tied high (straight binary) or between 00 0000 0000 0000 and 00 0000 0000 0001 for COMP BIN tied low (complementary binary).

Two's complement coding requires use of the MSB (pin 31) with the COMP BIN (pin 8) tied high, adjusting the gain trimming potentiometer so that the output code flickers equally between 01 1111 1111 1110 and 01 1111 1111 1111.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

CALIBRATION PROCEDURE

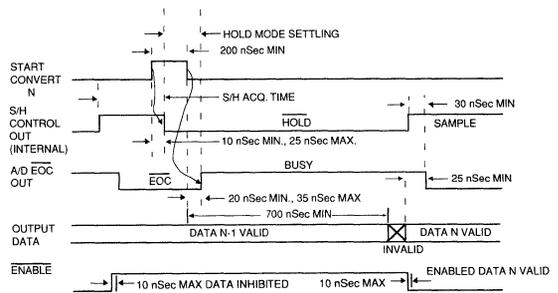

1. Connect the converter per Figure 3, and Table 1 for the appropriate full-scale range (FSR). Apply a pulse of 200 nano-seconds minimum to the START CONVERT input (pin 32) at a rate of 200 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

Table 1. Input Connections

| INPUT RANGE | INPUT PIN | TIE TOGETHER |
|-------------|-----------|--------------|
| 0 to -10V   | Pin 3     | Pins 2 and 4 |
| $\pm$ 5V    | Pin 3     | Pins 1 and 2 |

Table 2. Zero and Gain Adjust

| FSR       | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>FS - 1/2 LSB |
|-----------|-------------------------|-----------------------------|
| 0 to -10V | -305 $\mu$ V            | -9.999085V                  |
| $\pm$ 5V  | -305 $\mu$ V            | -4.999085V                  |

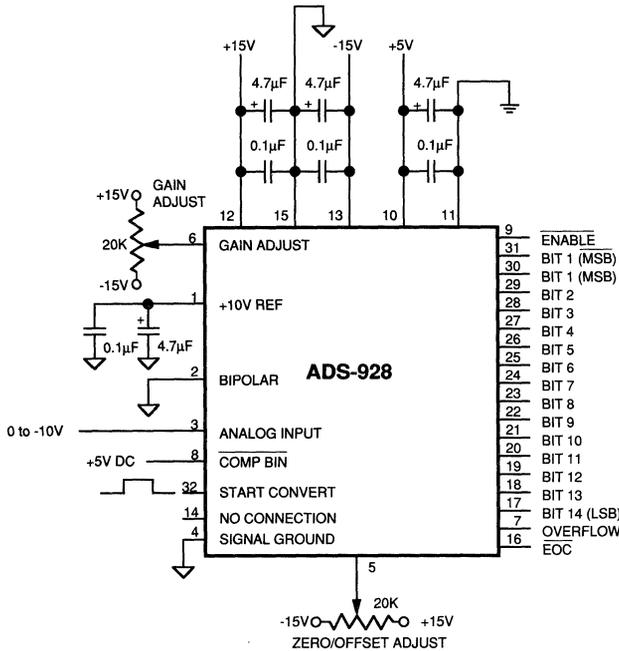

NOTE: NOT DRAWN TO SCALE  
Note: Retriggering START CONVERT before EOC goes low will not start a new conversion.

ORDERING INFORMATION

| MODEL NUMBER | OPERATING TEMP. RANGE              | SEAL     |
|--------------|------------------------------------|----------|
| ADS-928MC    | 0 °C to +70 °C                     | Hermetic |
| ADS-928MM    | -55 °C to +125 °C                  | Hermetic |
| ADS-EVAL1    | Evaluation Board (without ADS-928) |          |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 32 required.

For availability of MIL-STD-883B versions, contact DATEL.

### FEATURES

- 16-Bit resolution
- 500 KHz sampling rate
- Functionally complete
- Internal S/H
- Small 40-pin DIP
- Low-power, 2.1 Watts
- Three-state output buffers
- Samples up to Nyquist
- 16 word FIFO memory

### GENERAL DESCRIPTION

DATEL's ADS-930 is a 16-bit, 500 KHz sampling rate, functionally complete A/D converter with internal FIFO. The ADS-930 samples up to Nyquist with no missing codes.

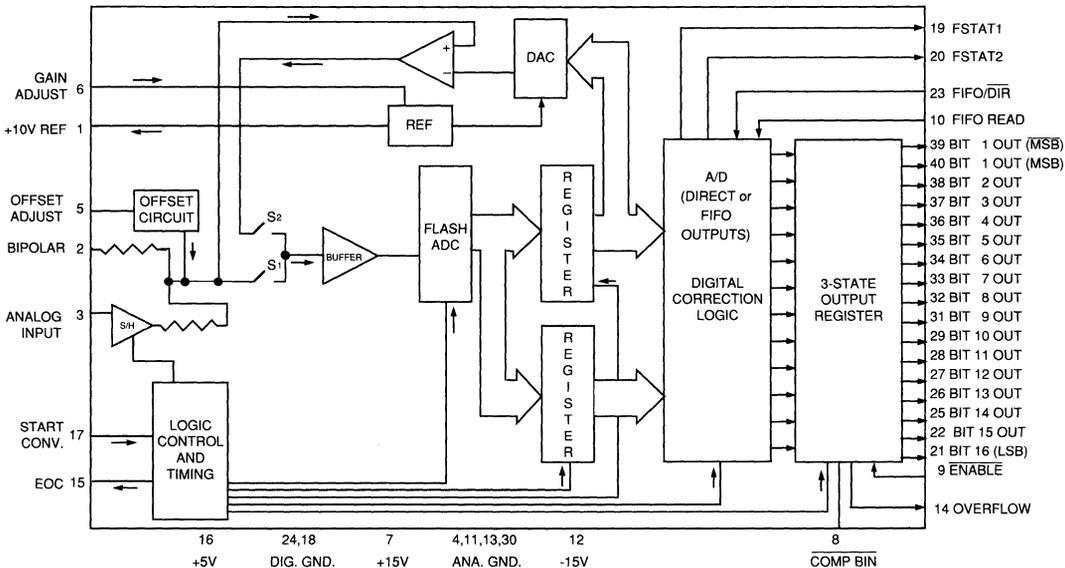

Packaged in a small 40-pin TDIP, power requirements are  $\pm 15$  Volts and +5 Volts with 2.1 Watts power dissipation.

### APPLICATIONS

- Spectroscopy
- Spectrum analysis
- Imaging
- Radar
- Medical instrumentation
- High-speed data acquisition systems

### I/O CONNECTIONS

**Specification footnotes**

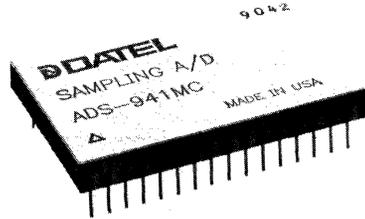

① +5V power usage at 1 TTL logic loading per data output bit.

Warm-up time to full specification: 5 minutes

#### PRELIMINARY PRODUCT DATA

#### FEATURES

- 14-Bit resolution
- 1.0 MHz minimum throughput
- Internal Sample/Hold
- Functionally complete
- Small 32-pin DIP
- Low-power, 2.8 Watts
- Three-state output buffers
- Samples up to Nyquist

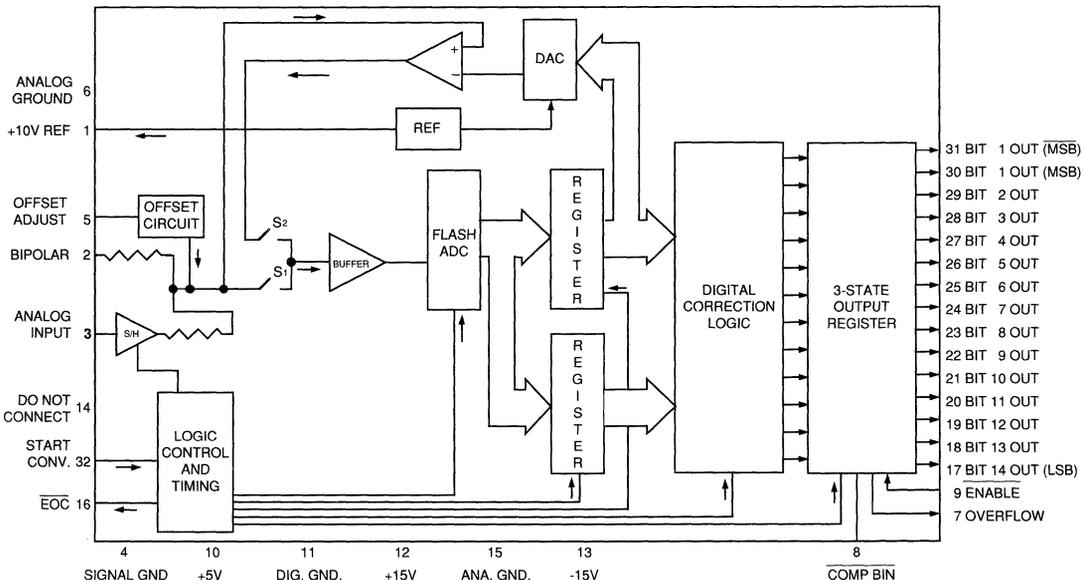

#### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION       | PIN | FUNCTION         |

| 16  | EOC            | 32  | START CONVERT    |

#### GENERAL DESCRIPTION

DATEL's ADS-941 is a 14-bit, 1.0 MHz sampling rate, functionally complete A/D converter. The ADS-941 samples up to Nyquist with no missing codes.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with 2.8 Watts power dissipation.

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                            | LIMITS       | UNITS    |
|---------------------------------------|--------------|----------|
| <b>+15V Supply (Pin 12)</b>           | -0.3 to +18  | Volts dc |
| <b>-15V Supply (Pin 13)</b>           | +0.3 to -18  | Volts dc |
| <b>+5V Supply (Pin 10)</b>            | -0.3 to +7.0 | Volts dc |
| <b>Digital Inputs (Pins 8, 9, 32)</b> | -0.3 to +7.0 | Volts dc |
| <b>Analog Input (Pin 3)</b>           | ±25          | Volts    |
| <b>Lead Temp. (10 Sec.)</b>           | 300 max      | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating range and at ±15V dc and +5V dc unless otherwise specified.②

① +5V power usage at 1 TTL logic loading per data output bit.  
② Warm-up time to full specification: 20 minutes.

TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 200 Ω trimming potentiometer in series with the analog input for gain adjustment. Use a short in place of the gain adjustment trim pot for operation without adjustments. Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (connect pin 5 to pin 15, analog ground for operation without adjustment).
2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7 μF, 25V tantalum electrolytic capacitor in parallel with a 0.1 μF ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 15).
4. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 8) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the COMP BIN pin to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To enable the three-state outputs, connect ENABLE (pin 9) to a logic "0" (low). To disable, connect ENABLE (pin 9) to a logic "1" (high).

2. Zero Adjustments

Apply a precision voltage reference source between the analog input (pin 3) and signal ground (pin 4). Adjust the output of the reference source per Table 2.

For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 00 0000 0000 and 00 0000 0000 0001 with the COMP BIN (pin 8) tied low (straight binary) or between 11 1111 1111 1111 and 11 1111 1111 1110 with the pin 8 tied high (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001 with pin 8 tied high (offset binary) or between 01 1111 1111 1111 and 01 1111 1111 1110 with pin 8 tied low (complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with COMP BIN (pin 8) tied high, adjusting the potentiometer such that the code flickers between 00 0000 0000 0000 and 00 0000 0000 0001.

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2.

Adjust the gain trimming potentiometer so that the output code flickers equally between 11 1111 1111 1110 and 11 1111 1111 1111 for COMP BIN (pin 8) tied low for unipolar operation or tied high for bipolar operation (straight binary/offset binary) or between 00 0000 0000 0000 and 00 0000 0000 0001 for COMP BIN tied high for unipolar operation or tied low for bipolar operation (complementary binary/complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with the COMP BIN (pin 8) tied high, adjusting the gain trimming potentiometer so that the output code flickers equally between 01 1111 1111 1110 and 01 1111 1111 1111.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 3.

CALIBRATION PROCEDURE

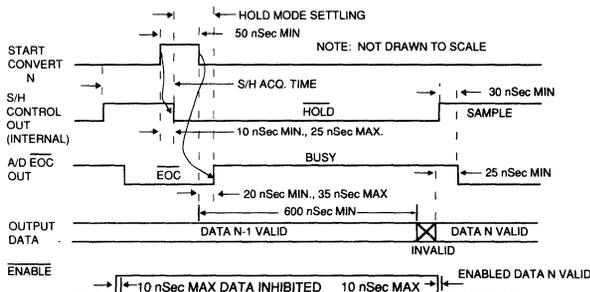

1. Connect the converter per Figure 3, and Table 1 for the appropriate full-scale range (FSR). Apply a pulse of 50 nano-seconds minimum to the START CONVERT input (pin 32) at a rate of 200 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

Table 1. Input Connections

| INPUT RANGE      | INPUT PIN      | TIE TOGETHER                 |
|------------------|----------------|------------------------------|
| 0 to -10V<br>±5V | Pin 3<br>Pin 3 | Pins 2 and 4<br>Pins 1 and 2 |

Table 2. Zero and Gain Adjust

| FSR              | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>FS - 1/2 LSB |
|------------------|-------------------------|-----------------------------|
| 0 to +10V<br>±5V | -305 μV<br>-305 μV      | -9.999085V<br>-4.999085V    |

NOTE: Retriggering the START CONVERT pulse before EOC goes low will not initiate a new conversion.  
NOTE: The specifications listed apply over the full operating temperature range unless otherwise specified.

ORDERING INFORMATION

| MODEL NUMBER | OPERATING TEMP. RANGE | SEAL     |
|--------------|-----------------------|----------|
| ADS-941MC    | 0 °C to +70 °C        | Hermetic |
| ADS-941MM    | -55 °C to +125 °C     | Hermetic |

ACCESSORY ADS-EVAL1 Evaluation Board (without ADS-941)

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 32 required.

For availability of MIL-STD-883B versions, contact DATEL.

#### FEATURES

- 14-Bit resolution
- Internal Sample/Hold
- 2.0 MHz minimum throughput
- Functionally complete
- Small 32-pin DIP
- Low-power 2.9 Watts
- Three-state output buffers
- Samples up to Nyquist

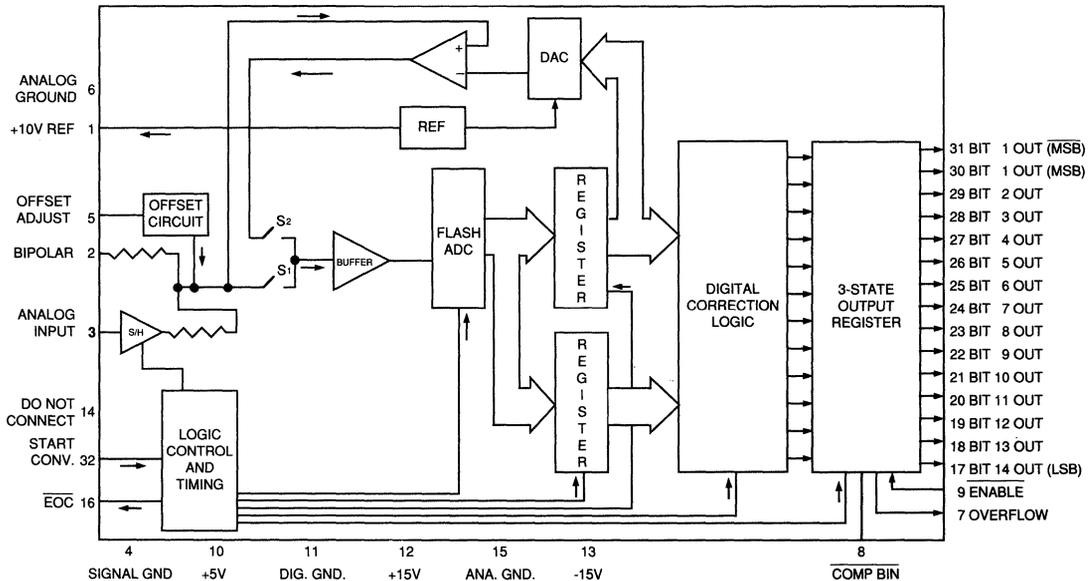

#### GENERAL DESCRIPTION

DATTEL's ADS-942 is a 14-bit, 2.0 MHz sampling rate, functionally complete A/D converter. The ADS-942 samples up to Nyquist with no missing codes.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with 2.9 Watts power dissipation.

#### INPUT/OUTPUT CONNECTIONS

① +5V power usage at 1 TTL logic loading per data output bit.

② Warm-up time to full specification: 20 minutes.

TECHNICAL NOTES

- Use external potentiometers to remove system errors or the small initial errors to zero. Use a 200 Ω trimming potentiometer in series with the analog input for gain adjustment. Use a short in place of the gain adjustment trim pot for operation without adjustments. Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (connect pin 5 to pin 15, analog ground for operation without adjustment).
- Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
- Bypass the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7 μF, 25V tantalum electrolytic capacitor in parallel with a 0.1 μF ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 15).
- Obtain straight binary/offset binary output coding by tying COMP BIN (pin 8) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie pin 18 to ground. The pin 18 signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- To enable the three-state outputs, connect ENABLE (pin 9) to a logic "0" (low). To disable, connect pin 9 to a logic "1" (high).

2. Zero Adjustments

Apply a precision voltage reference source between the analog input (pin 3) and signal ground (pin 4). Adjust the output of the reference source per Table 2.

For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 00 0000 0000 0000 and 00 0000 0000 0001 with the COMP BIN (pin 8) tied low (straight binary) or between 11 1111 1111 1111 and 11 1111 1111 1110 with the pin 8 tied high (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001 with pin 8 tied high (offset binary) or between 01 1111 1111 1111 and 01 1111 1111 1110 with pin 8 tied low (complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with COMP BIN (pin 8) tied high, adjusting the potentiometer such that the code flickers between 00 0000 0000 0000 and 00 0000 0000 0001.

3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 2.

Adjust the gain trimming potentiometer so that the output code flickers equally between 11 1111 1111 1110 and 11 1111 1111 1111 for COMP BIN (pin 8) tied low for unipolar operation or tied high for bipolar operation (straight binary/offset binary) or between 00 0000 0000 0000 and 00 0000 0000 0001 for COMP BIN tied high for unipolar operation or tied low for bipolar operation (complementary binary/complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with the COMP BIN (pin 8) tied high, adjusting the gain trimming potentiometer so that the output code flickers equally between 01 1111 1111 1110 and 01 1111 1111 1111.

CALIBRATION PROCEDURE

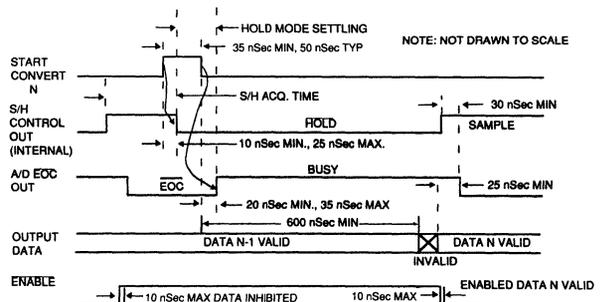

- Connect the converter per Figure 3, and Table 1 for the appropriate full-scale range (FSR). Apply a pulse of 35 nanoseconds minimum to the START CONVERT input (pin 32) at a rate of 200 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

Table 1. Input Connections

| INPUT RANGE      | INPUT PIN      | TIE TOGETHER                 |
|------------------|----------------|------------------------------|
| 0 to +10V<br>±5V | Pin 3<br>Pin 3 | Pins 2 and 4<br>Pins 1 and 2 |

Table 2. Zero and Gain Adjust

| FSR              | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>FS - 1/2 LSB |
|------------------|-------------------------|-----------------------------|
| 0 to +10V<br>±5V | -305 μV<br>-305 μV      | +9.999085V<br>-4.999085V    |

NOTE:

- Retriggering the start convert pulse before EOC goes low will not initiate a new conversion.
- The specifications cited apply over the full operating temperature range.

**ORDERING INFORMATION**

| MODEL NUMBER     | OPERATING TEMP. RANGE | SEAL                               |
|------------------|-----------------------|------------------------------------|
| ADS-942MC        | 0 °C to +70 °C        | Hermetic                           |
| ADS-942MM        | -55 °C to +125 °C     | Hermetic                           |
| <b>ACCESSORY</b> | ADS-EVAL1             | Evaluation Board (without ADS-942) |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 32 required.

For availability of MIL-STD-883B versions, contact DATEL.

### ADVANCED PRODUCT DATA

#### FEATURES

- 14-Bit resolution
- Internal Sample/Hold
- 5.0 MHz minimum throughput
- Functionally complete
- Small 32-pin DIP
- Low-power 3.4 Watts
- Three-state output buffers
- Samples up to Nyquist

#### GENERAL DESCRIPTION

DATEL's ADS-944 is a 14-bit, 5.0 MHz sampling rate, functionally complete sampling A/D converter. The ADS-944 samples up to Nyquist with no missing codes.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with 3.4 Watts power dissipation.

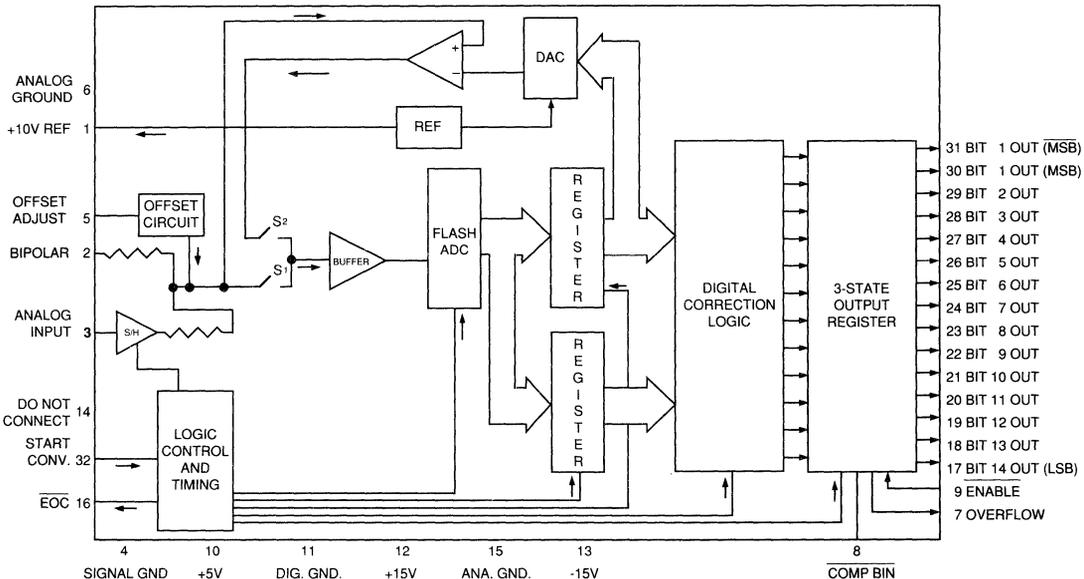

The ADS-944 is offered in the commercial 0 to +70 °C and military -55 to +125 °C operating temperature range.

#### APPLICATIONS

- Spectrum analysis
- Imaging
- Radar
- Medical instrumentation
- High-speed data acquisition systems

#### FEATURES

- 14-Bit resolution
- 10 MHz sampling rate
- Functionally complete
- Internal S/H
- Small 40-pin DIP
- Low-power, 4.2 Watts
- Three-state output buffers
- Samples up to Nyquist
- 16 word FIFO memory

#### GENERAL DESCRIPTION

DATEL's ADS-945 is a 14-bit, 10 MHz sampling rate, functionally complete A/D converter with internal FIFO. The ADS-945 samples up to Nyquist with no missing codes.

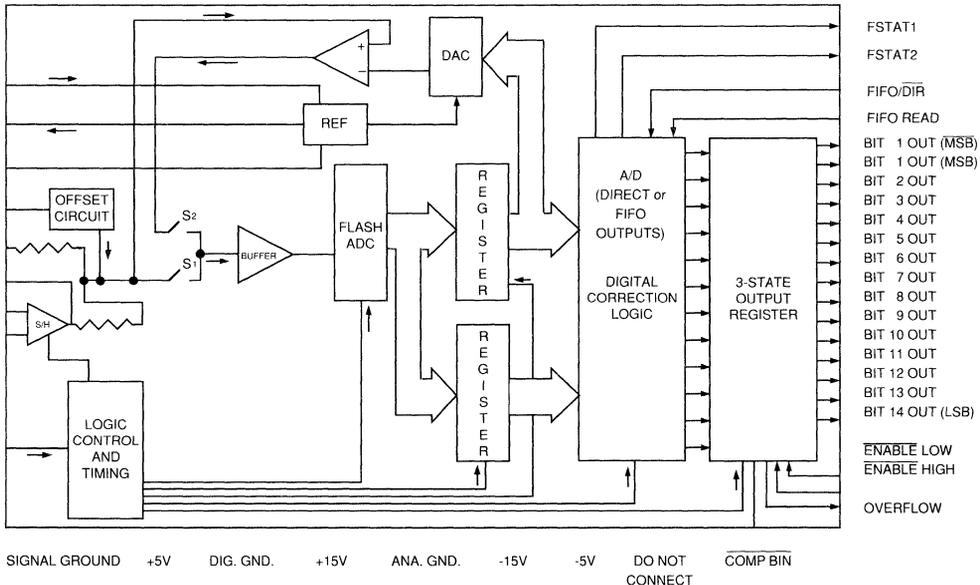

Packaged in a small 40-pin TDIP, power requirements are  $\pm 15$  Volts and  $\pm 5$  Volts with 4.2 Watts power dissipation.

#### APPLICATIONS

- Spectroscopy
- Spectrum analysis
- Imaging
- Radar
- Medical instrumentation
- High-speed data acquisition systems

#### FEATURES

- 16-bit resolution
- 200 KHz sampling rate
- Compatible to industry standard ADC76, AD376, AD1376
- Internal sample-hold
- Small 32-pin DIP
- Low-power, 1.8 Watts
- Samples to Nyquist
- 16 word FIFO memory

#### GENERAL DESCRIPTION

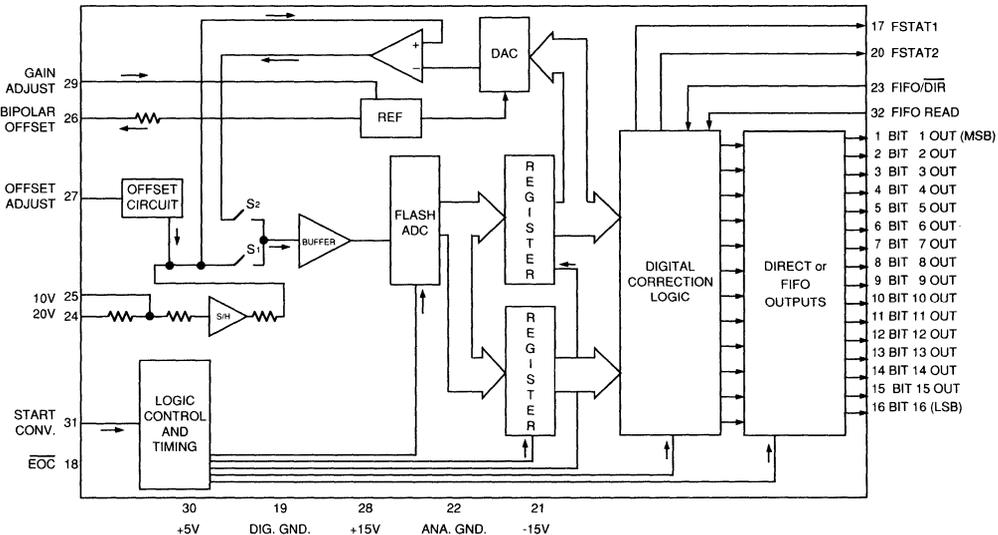

DATEL's ADS-976 is a 16-bit, 200 KHz sampling rate, functionally complete A/D converter with an internal sample-hold. The ADS-976 samples up to Nyquist with no missing codes.

The internal FIFO can be either bypassed or utilized with full (16 words) or half-full (8 words). The FIFO capability still allows the ADS-976 to be compatible to the industry pin-out versions for 16-bit parallel output applications.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with a 1.8 Watts power dissipation.

#### INPUT/OUTPUT CONNECTIONS

#### FEATURES

- 7-Bit flash A/D converter
- 20 MHz Sampling rate
- Low-power (250 mW)
- +5V dc Operation
- 1.2 Micron CMOS
- 7-bit latched 3-state output with overflow bit
- Surface mount versions
- MIL-STD-883 versions
- No missing codes

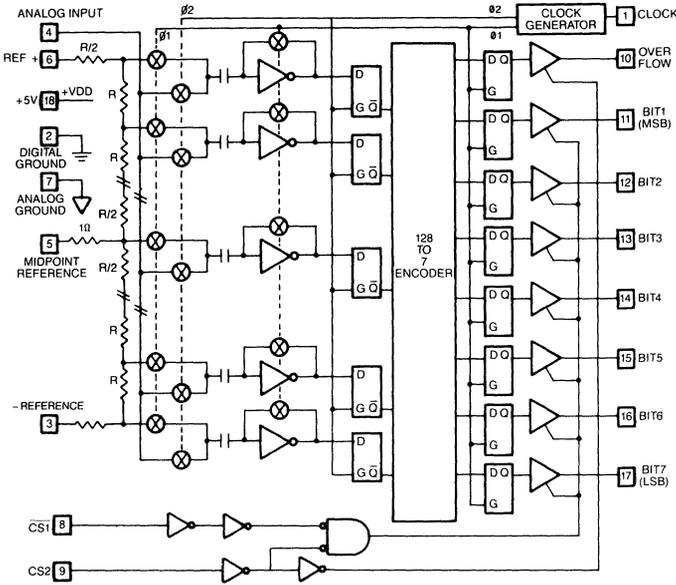

#### MECHANICAL DIMENSIONS

#### GENERAL DESCRIPTION

The ADC-207 is the industry's first 7-bit flash converter using a high-speed 1.2 micron CMOS process. This process offers some very distinctive advantages over other processes, making the ADC-207 a very unique device. The smaller geometrics of the process achieves high-speed, better linearity and better temperature performance. Since the ADC-207 is a CMOS device, it also has very low power consumption (250 mW). The device draws power from a single +5V supply, and is conservatively rated for 20 MHz operation. The ADC-207 allows using sampling apertures as small as 12nS, making it more closely approach an ideal sampler. The small sampling apertures also let the device operate at greater than 20 MHz.

#### INPUT/OUTPUT CONNECTIONS

| DIP PINS | FUNCTION       | LCC PINS |

- NOTES:**
- At full power input and chip selects enabled
  - At 4 MHz input and 20 MHz clock
  - For 10-step, 40 IRE NTSC ramp test

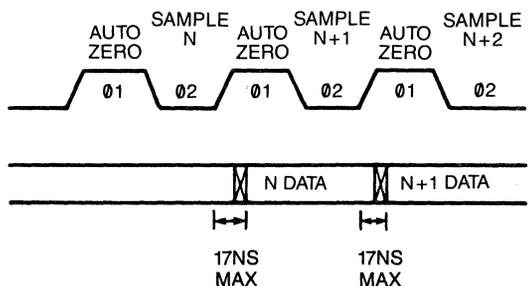

## TECHNICAL NOTES

- Input Buffer Amplifier**—Since the ADC-207 has a switched capacitor type input, the input impedance of the 207 is dependent on the clock frequency. At relatively slow conversion rates a general purpose type input buffer can be used; at high conversion rates DATEL recommends either the HA-5033, the LH-0033 or Elantec 2003. See Figure 2 for typical connections.
- Reference Ladder**—Adjusting the voltage at +Ref adjusts the gain of the ADC-207. Adjusting the voltage at -Ref adjusts the offset or zero of the ADC-207. The midpoint pin is usually bypassed to ground through a .1uf capacitor, although it can be tied to a precision voltage half-way between +Ref and -Ref. This would improve integral linearity beyond 7 bits.
- Clock Pulse Width**—To improve performance at Nyquist bandwidths, the clock duty cycle can be adjusted so that the low portion of the clock pulse is 12 nseconds wide. The smaller aperture allows the ADC-207 to closely resemble an ideal sampler.

## CAUTION

Since the ADC-207 is a CMOS device, normal precautions against static electricity should be taken. use ground straps, grounded mats, etc. The Absolute Maximum Ratings of the device **MUST NOT BE EXCEEDED** as irrevocable damage to the ADC-207 will occur.

## TIMING DIAGRAM

**OUTPUT CODING**

(+Ref= +5.12V, -Ref=Gnd, MID POINT=no connection)

NOTE: The reference should be held to 0.1% accuracy or better. Do not use the +5V power supply as a reference input without precision regulation and high frequency decoupling.

Values shown here are for a 5.12Vdc reference. Scale other references proportionally. Calibration equipment should test

for code changes at the midpoints between these center values shown in Table 1. For example, at the half-scale major carry, set the input to 2.54V and adjust the reference until the code flickers equally between 63 and 64. Note also that the weighting for the comparator resistor network leaves the first and last thresholds to within 1/2 LSB of the end points to adjust the code transition to the proper midpoint values.

Table 1. ADC-207 Output Coding

| Analog In (Center Value) | Code            | Overflow | 1<br>MSB | 2 | 3 | 4 | 5 | 6 | 7<br>LSB | Decimal | Hexadecimal (incl. 0V) |

\* — Note that the overflow code does not clear the data bits.

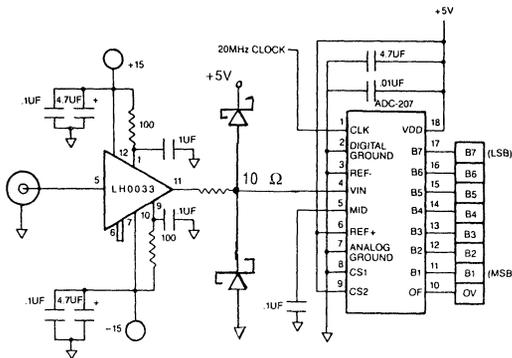

Figure 2. Typical Connections for Using the ADC-207

**CHIP SELECT**

The 3-state buffer has two enable lines, CS1 and CS2. Table 2 shows the truth table for chip select signals. CS1 has the function of enabling/disabling bits 1 through 7. CS2 has the function of enabling/disabling bits 1 through 7 and the overflow bit. Also a full-scale input produces all ones, including the overflow bit at the output.

Table 2. Chip Select Truth Table

| CS1 | CS2 | Bits 1-7      | Overflow Bit  |
|-----|-----|---------------|---------------|
| 0   | 0   | 3 State Mode  | 3 State Mode  |
| 1   | 0   | 3 State Mode  | 3 State Mode  |
| 0   | 1   | DATA Outputed | DATA Outputed |
| 1   | 1   | 3 State Mode  | DATA Outputed |

### FEATURES

- 8-Bit flash A/D converter
- 20 MHz sampling rate
- 10 MHz full-power bandwidth
- Sample-hold not required
- Low power CMOS
- +5V dc operation
- 1.2 Micron CMOS
- 8-Bit latched three-state outputs with overflow bit
- Surface mount versions
- MIL-STD-883B versions
- No missing codes

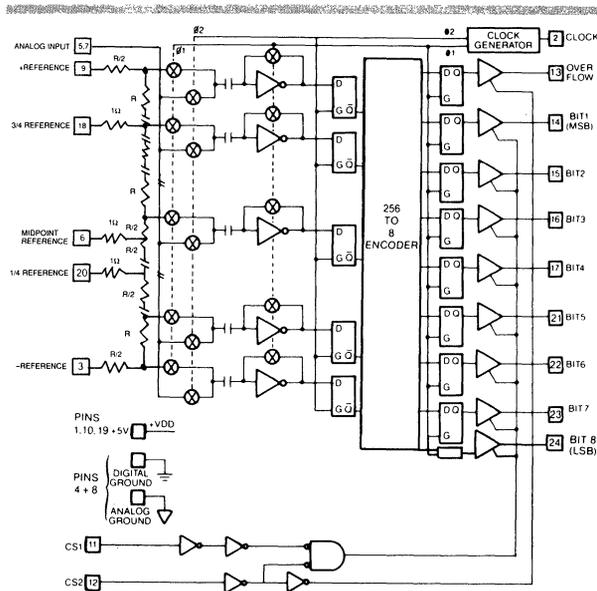

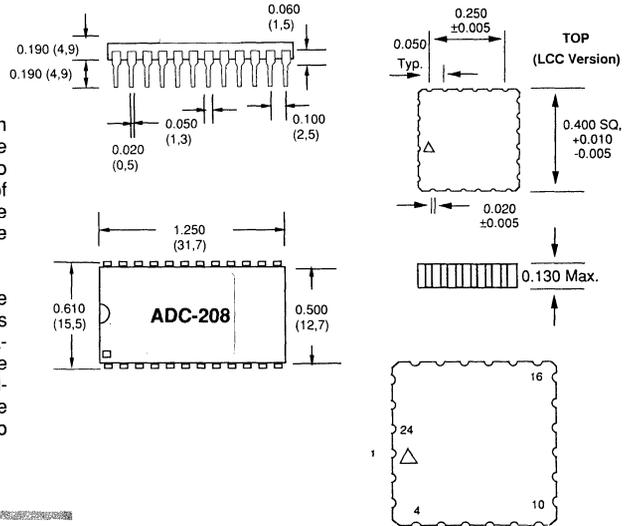

ADC-208 DIP

ADC-208 LCC

### GENERAL DESCRIPTION

The ADC-208 utilizes an advanced VLSI 1.2 micron CMOS in providing 20 MHz sampling rates at 8-bits. The flexibility of the design architecture and process delivers effective bit rates to 30 MHz in the burst mode, one shot mode conversion times of 35 nanoseconds, low power modes to 150 mW, latch-up free operation without external components and operation over the full military temperature range.

The ADC-208 has 256 auto-zeroing comparators which are auto-balanced on every conversion to cancel out any offsets due to temperature and/or dynamic effects. These comparators sample the difference between the analog input and the reference voltages generated by the precision reference ladder network. Parallel output data and the overflow pin have Three-State outputs. The overflow pin allows cascading two devices for 9-bit operation.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION              |
|-----|-----------------------|
| 1   | VDD                   |
| 2   | CLOCK                 |
| 3   | -REFERENCE            |
| 4   | ANA/DIG GND (VSS)     |
| 5   | ANALOG INPUT          |
| 6   | REFERENCE MID-POINT   |
| 7   | ANALOG INPUT          |
| 8   | ANA/DIG GND (VSS)     |
| 9   | +REFERENCE            |
| 10  | VDD                   |
| 11  | CS1 (OUTPUT ENABLE)   |
| 12  | CS2 (OVERFLOW ENABLE) |
| 13  | OVERFLOW BIT          |
| 14  | BIT 1 (MSB)           |
| 15  | BIT 2                 |
| 16  | BIT 3                 |
| 17  | BIT 4                 |
| 18  | REF 3/4 FS            |
| 19  | VDD                   |
| 20  | REF 1/4 FS            |
| 21  | BIT 5                 |
| 22  | BIT 6                 |
| 23  | BIT 7                 |
| 24  | BIT 8 (LSB)           |

**ABSOLUTE MAXIMUM RATINGS**

| DESCRIPTION  | LIMITS                        | UNITS |
|--|-------------------------------|-------|
| Power Supply Voltage<br>(V <sub>DD</sub> Pin 1,10,19)  | -0.5 to +7.0                  | V dc  |

- ① Maximum input impedance is a function of clock frequency.
- ② At full power input and chip selects enabled.
- ③ For 10-step, 40 IRE NTSC ramp test.

**TECHNICAL NOTES**

1. The Reference ladder is floating with respect to V<sub>DD</sub> and may be referenced anywhere within the specified limits. AC modulation of the reference voltage may also be utilized; contact DATEL for further information.
2. Clock Pulse Width - To improve performance when input signals may exceed Nyquist bandwidths, the clock duty cycle can be adjusted so that the low portion (sample mode) of the clock pulse is 15 nanoseconds wide. Reducing the sampling

Table 1. ADC-208 Output Coding

| ANALOG INPUT | CODE          | OVER FLOW | DATA BITS |      | DECIMAL | HEX |
|--------------|---------------|-----------|-----------|------|---------|-----|
|              |               |           | 1234      | 5678 |         |     |
| 0.00 V       | Zero          | 0         | 0000      | 0000 | 0       | 00  |
| +0.02 V      | +1 LSB        | 0         | 0000      | 0001 | 1       | 01  |
| +1.28 V      | +1/4 FS       | 0         | 0100      | 0000 | 64      | 40  |
| +2.54 V      | +1/2 FS-1 LSB | 0         | 0111      | 1111 | 127     | 7F  |
| +2.56 V      | +1/2 FS       | 0         | 1000      | 0000 | 128     | 80  |
| +2.58 V      | +1/2 FS+1 LSB | 0         | 1000      | 0001 | 129     | 81  |
| +3.84 V      | +3/4 FS       | 0         | 1100      | 0000 | 192     | C0  |
| +5.10 V      | +FS           | 0         | 1111      | 1111 | 255     | FF  |
| +5.12 V      | Overflow      | 1         | 1111      | 1111 | 511*    | 1FF |

\* Note the overflow code does not clear the data bits.  
 Values shown here are for a +5.12Vdc reference. Scale other references proportional!  
 (+REF = +5.12V, -REF = GND, 1/4, 1/2, and 3/4 Reference FS = No Connection)

time period minimizes the amount the input voltage slews and prevents the comparators from saturating.

3. The parallel output data and Overflow pin become available at the three-state buffer output when enabled. A full-scale input produces all "1"s on the data outputs. The OVERFLOW pin goes "high" when the analog input level exceeds + REF minus 1/2 LSB. Table 2 shows the truth table for the chip select enable signals.

4. DATEL uses the conservative definitions when specifying Integral Linearity (end-point) and Differential Linearity (code transition). The specifications using the less conservative definition have also been provided as a comparative specification for products specified this way.

5. The process that is used to fabricate the ADC-208 eliminates the latchup phenomena that has plagued CMOS devices in the past. The ADC-208 does not require external protection diodes.

Table 2. Chip Select Truth Table

| CS1 | CS2 | Bits 1-8       | Overflow Bit   |
|-----|-----|----------------|----------------|
| 0   | 0   | Tri-State Mode | Tri-State Mode |
| 1   | 0   | Tri-State Mode | Tri-State Mode |
| 0   | 1   | DATA Outputted | DATA Outputted |
| 1   | 1   | Tri-State Mode | DATA Outputted |

**CALIBRATION PROCEDURE**

1. Connect the converter appropriately; a typical connection circuit is shown in Figure 2. Then apply an appropriate clock input. The ADC-208's reference input should be held to ±0.1% accuracy or better. Do not use the +5V power supply as a reference without precision regulation and high frequency decoupling capacitors.

**2. Zero Adjustment**

Apply a precision voltage reference source between the analog input (pins 5 & 7) and ground. Adjust the output of the reference source per Table 1 for the Unipolar Zero adjustment (+ 1/2 LSB). Adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 and 0000 0001. Ground -REFERENCE (pin 3) for operation without adjustment.

**3. Full Scale Adjustment**

Set the output of the voltage reference used in step 2 to the value shown in Table 1 for the Unipolar Gain Adjustment (+FS -1 1/2 LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1110 and 1111 1111. The + REFERENCE (pin 9) should be tied directly to a +5V reference for operation without adjustment.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 1.

**5. Integral Nonlinearity Adjustments**

Provision is made for optional adjustment of Integral Nonlinearity through access of the reference's 1/4, 1/2 & 3/4 Full Scale points. For example, at the half-scale major carry, set the input to 2.55V and adjust the reference until the code flickers equally between 127 and 128 for a 5.12V Full Scale input.

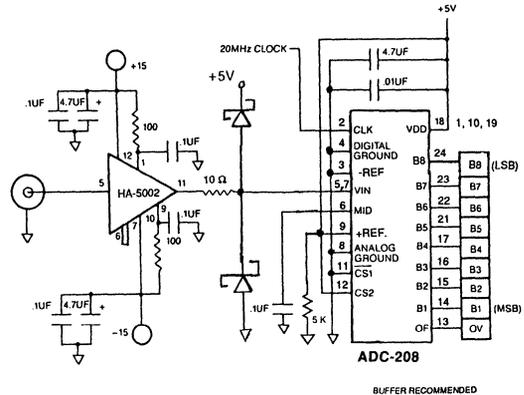

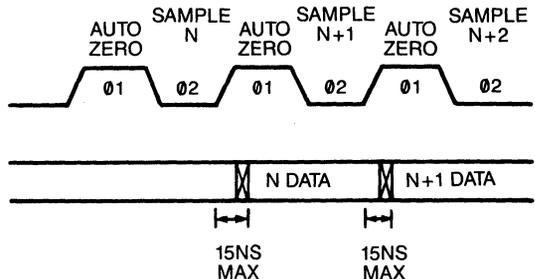

Figure 2. ADC-208 Typical Connections

**NOTES:**

Tie all VDD pins (1,10, & 19) together. Tie both Analog Input pins (5 & 7) together. Connect both ANA/DIG GNDs (VSS pins 4 & 8) to one point, the ground plane beneath the converter.

Timing Diagram

## LOW POWER MODES

### Power Supply Aspect of Power Dissipation

Reduction of the  $V_{DD}$  power supply of the ADC-208 results in lower power dissipation. Refer to the curve of Figure 3 for power dissipation as a function of  $V_{DD}$ . The limiting factor is  $V_{DD}$  must be greater than the TTL or CMOS output levels. Interfacing to standard logic families presents little problem as the output drivers go to  $V_{DD}$  for a high state and to  $V_{SS}$  for a low state.

### BURST MODE

Applications can utilize an inherent system clock up to 30 MHz in the burst mode. The system clock can generate a one shot for a single conversion without requiring generation of a separate clock at a lower frequency.

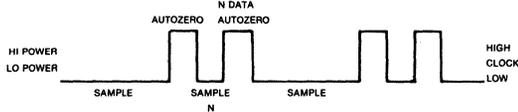

Figure 4. Burst Mode for Low Power

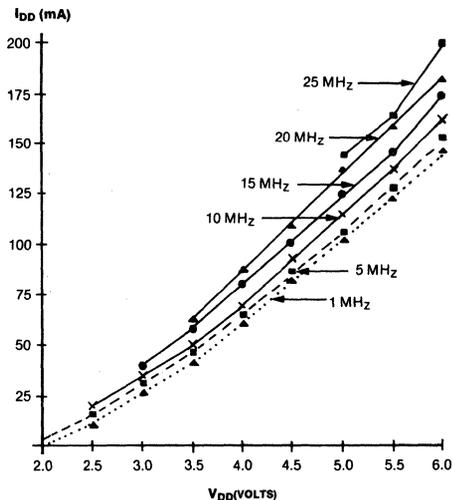

Figure 3. Power Dissipation Versus  $V_{DD}$

Figure 5 shows power dissipation as a function of burst rate and repetition rate. Applications not requiring continuous conversions can give a double clock pulse, the clock returning low between conversions to reduce power dissipation. Power dissipation is essentially eliminated when the clock and signal input are turned off.

Figure 6 shows power dissipation as a function of the clock duty cycle. A conversion time of 35 nanoseconds can be obtained for a single conversion by leaving the clock in the Auto-zero mode. To initiate a conversion, the clock is put in the sample mode for 25 nanoseconds and then brought back high

to the Auto-zero mode. Data is valid 15 nanoseconds after the clock goes high, eliminating the pipeline delay.

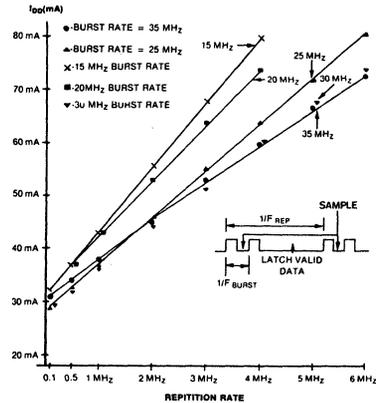

Figure 5. Power Dissipation vs. Burst Rate vs. Repetition Rate

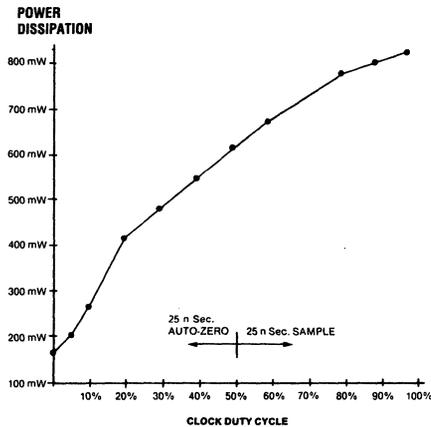

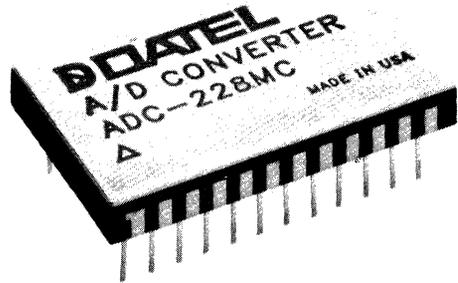

Figure 6. Power Dissipation vs. Duty Cycle for One-Shot Mode

### ORDERING INFORMATION

### FEATURES

- 8-Bit Flash A/D converter
- 20 MHz Sampling rate
- Complete support circuitry
- Low power, 1.5W
- 10 MHz Full power bandwidth
- Sample-hold not required
- Three-state outputs
- MIL-STD-883B versions

### GENERAL DESCRIPTION

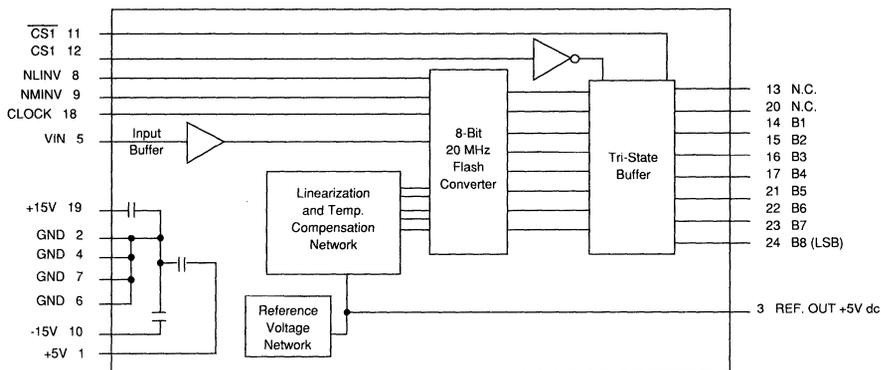

The ADC-228 combines analog front-end circuitry and a flash A/D converter to digitize high speed analog signals at a 20 mega samples per second rate. The ADC-228 contains an 8-bit, 20 MHz, flash A/D, a wideband analog input buffer, a precision voltage reference, temperature compensation circuitry, reference trims, and a three-state output buffer in a 24-pin package.

The ADC-228 offers significant savings by combining all of the circuitry in a single package. Valuable board real estate is saved, and design time and manufacturing costs are reduced to achieve these savings.

The ADC-228 is housed in a 24-pin hermetically sealed package and is available in the commercial, 0 to +70 °C, and military, -55 to +125 °C, temperature ranges. Operation is from ±15V and +5V dc power supplies.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION      | PIN | FUNCTION      |
|-----|---------------|-----|---------------|
| 1   | +5V POWER IN  | 24  | BIT 8         |

**NOTES**

1. At full power input and chip selects enabled.
2. For 10-step, 40 IRE NTSC ramp test

TECHNICAL NOTES

1. Rated performance requires using good high frequency techniques. The analog and digital grounds are connected internally. Avoid ground related problems by connecting the grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
2. Bypass all the analog and digital supplies and the + reference (pin 3) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor.
3. DATEL uses the conservative definitions when specifying Integral Linearity (end-point) and Differential Linearity (code transition). The specifications using the less conservative definition have also been provided as a comparative specification for products specified this way.
4. Single conversions (one-shot mode) would require another clock edge to read out data. Users desiring to provide just a single clock pulse could use the circuit shown in Figure 2 to obtain the data.

**ORDERING INFORMATION**

| MODEL        | TEMP. RANGE    | PACKAGE    |
|--------------|----------------|------------|
| ADC-228MC    | 0 to +70 °C    | 24-pin DIP |
| ADC-228MM    | -55 to +125 °C | 24-pin DIP |
| ADC-228/883B | -55 to +125 °C | 24-pin DIP |

Receptacle for PC board mounting can be ordered through AMP Inc., part # 3-331272-8 (component lead socket), 24 required.

#### FEATURES

- 8-Bit resolution
- $\pm 1/2$  LSB non-linearity
- 20 MHz conversion rate
- 8 MHz input bandwidth (-3 dB)
- Low-power consumption (390 mW)
- TTL-compatible
- Single or dual supply operation

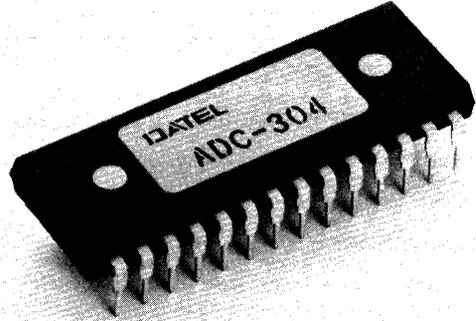

#### GENERAL DESCRIPTION

DATEL's ADC-304 is an 8-bit, 20 MHz analog-to-digital flash converter. The ADC-304 offers many performance features not obtainable from other flash A/D's.

Key features include a low-power dissipation of 390 mW and TTL compatible outputs. A wide analog input bandwidth of 8 MHz (-3 dB) allows operation without the need of a sample-hold. Also, single +5V supply operation is obtainable with an input range of +3 to +5V, eliminating the need for an additional power supply. A 0 to -2 V input range is available with  $\pm 5V$  supply operation.

Another novel feature of the ADC-304 is its user-selectable output coding. The MINV and LINV pins allow selection of binary, complementary binary, and if external offset circuitry is used for bipolar inputs, offset binary, two's complement, and complementary two's complement coding.

The ADC-304 is supplied in a 28-pin dual in-line package and operates over a -20°C to +75°C temperature range. Storage temperature range is from -65°C to +150°C.

#### MECHANICAL DIMENSIONS

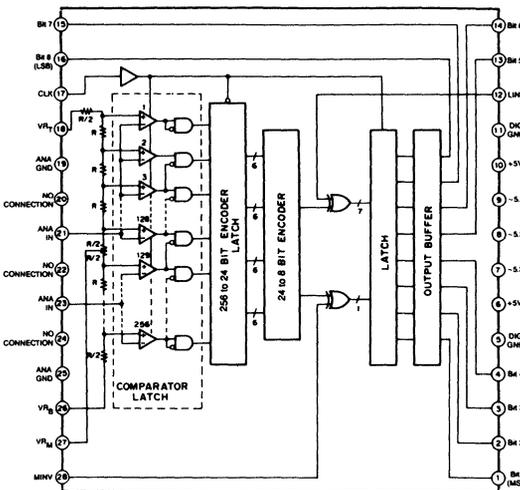

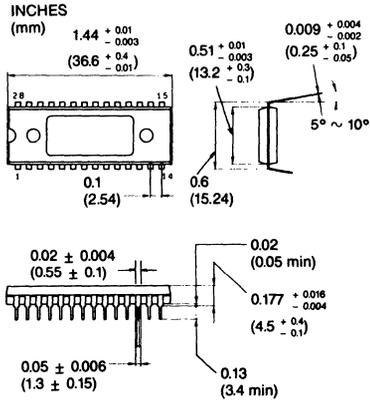

Table 1. ADC-304 Input/Output Connections

| Pin | Function                       | Pin | Function        |
|-----|--------------------------------|-----|-----------------|
| 1   | BIT 1 OUT (MSB)                | 15  | BIT 7 OUT       |

**FUNCTIONAL SPECIFICATIONS**

Unless otherwise noted, the following specifications apply to the ADC-304 when used either with a single or dual power source. The test conditions are:

For Single Power Supply Operation:

- V<sub>CC</sub> (Pins 6 + 10) = +5V, DIG GND = 0V
- V<sub>EE</sub> (Pins 7, 8 + 9) = 0V, V<sub>RT</sub> (Pin 18) = +5V
- V<sub>RB</sub> (Pin 26) = +3V, Ta = 25°C
- ANA GND (Pins 19 + 25) = +5V

For Dual Power Supply Operation:

- V<sub>CC</sub> (Pins 6 + 10) = +5V, DIG GND (Pins 5 + 11) = 0V
- ANA GND = 0V, V<sub>EE</sub> = -5V
- V<sub>RT</sub> (Pin 18) = 0V, V<sub>RB</sub> (Pin 26) = -2V
- Ta = 25°C

**TECHNICAL NOTES**

1. DIG GND pins (5 and 11) and V<sub>CC</sub> pins (6 and 10) connect to separate internal circuits within the ADC-304. Connect these pins to their respective PCB patterns.
2. Layout of the analog and digital sections should be separated to reduce interference from noise. To further guard against unwanted noise, it is recommended to bypass, as close as possible, the voltage supply pins (6,10) to their respective ground pins (5,11) with a 1 μF and a 0.01 μF ceramic disk capacitor in parallel.
3. The input capacitance of the analog input is much smaller than that of a typical Flash A/D Converter. It is necessary to use an amplifier with sufficient bandwidth and driving power. The analog input pins (21,23) are separated internally, so they should be connected together externally. If the ADC-304 is driven with a low- output impedance amplifier, parasitic oscillations may occur.

These parasitic oscillations can be prevented by introducing a small resistance of 2 to 10Ω between the amplifier output and the ADC-304's A/D input. This resistance must be of very low value of inductance at high frequencies.

Note that each of the analog input pins are divided in this manner with these resistances. Connect the driving amplifier as close as possible to the A/D input of the ADC-304.

4. The voltage between V<sub>RT</sub> (pin 18) and V<sub>RB</sub> (pin 26) is equivalent to the dynamic range of the analog input. Bypass V<sub>RB</sub> to ANA GND (pins 19 and 25) by means of a 1 μF and 0.01 μF capacitor in parallel. To balance the characteristics of the ADC-304 at high frequencies, bypass V<sub>RM</sub> (pin 27) with a 0.01μF capacitor to ANA GND (pins 19 and 25).

Also, V<sub>RM</sub> (pin 27) can be used as a trimming pin for more precise linearity compensation. A stable voltage source with a potential equal to -FSR and a 1 KΩ potentiometer can be connected to V<sub>RM</sub> (pin 27) as shown in Figure 3 for this purpose.

5. Separate the clock input, CLK (pin 17), from other leads as much as possible, observing proper EMI and RFI wiring techniques. This will reduce the inductive pick-up of this lead from interfering with the "clean" operation of the ADC-304.

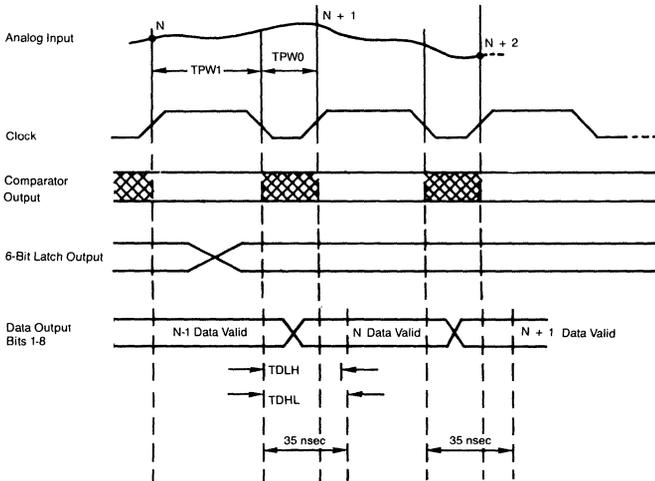

Figure 2: ADC-304 Timing Diagram

TECHNICAL NOTES (CONT.)

6. The analog input signal is sampled on the positive-going edge of CLK. Corresponding digital data appears at the output on the negative-going edge of the CLK pulse after a small delay of 35 nSec. maximum (TDLH, TDHL). Refer to the Timing diagram, Figure 4, for more information.
7. Connect all free pins to ANA GND (pins 19 and 25) to reduce unwanted noise.

The analog input range is equal to a 2V spread. The voltage on VR<sub>T</sub>-VR<sub>B</sub> will equal 2V. The connection of VR<sub>T</sub> and ANA GND is 2V higher than VR<sub>B</sub>. Whether using a single or dual power supply, the analog input will range from the value of VR<sub>T</sub> to VR<sub>B</sub>. If VR<sub>T</sub> equals +5V, then VR<sub>B</sub> will equal +3V and the analog input range will be from +5 to +3V.

| MODEL   | DESCRIPTION                         |
|---------|-------------------------------------|
| ADC-304 | 8-bit, 20 MHz, Low-power, flash A/D |

# ADC-500, ADC-505

## 12-Bit, Ultra-Fast, Low-Power A/D Converters

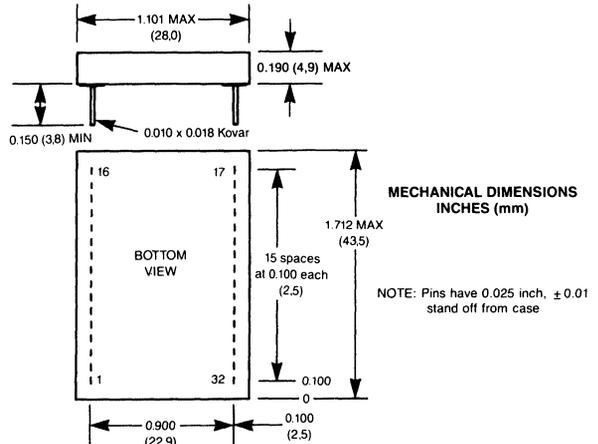

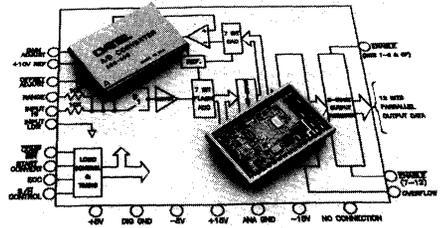

### FEATURES

- 12-Bit resolution
- 500 Nanosecond maximum conversion time
- Low-power, 1.6W
- Small initial errors
- Three-state output buffers
- -55°C to +125°C operation
- Small 32-pin DIP
- No missing codes

### GENERAL DESCRIPTION

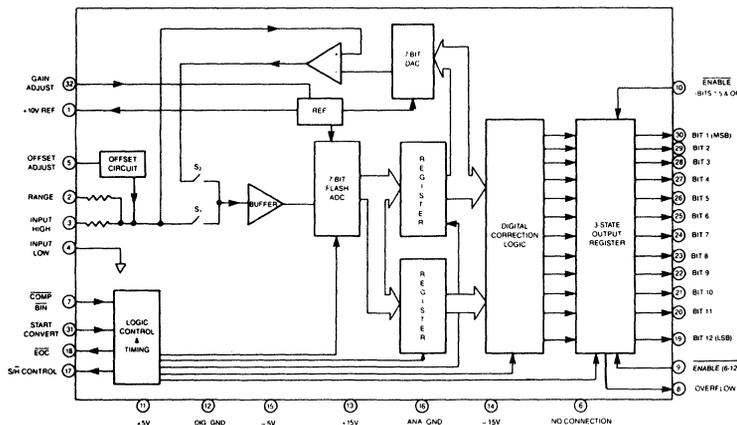

DATEL's ADC-500 and ADC-505 are 12-bit analog-to-digital converters which have small initial errors and can also provide adjustment capability for system errors. Both models have identical specifications except for conversion times. The ADC-505 has a maximum conversion time of 550 nanoseconds while the ultra-fast ADC-500 accomplishes a 12-bit conversion in less than 500 nanoseconds. Figure 1 is a simplified block diagram applicable to both devices.

Manufactured using thick-film and thin-film hybrid technology, these converters' remarkable performances are based upon a digitally-corrected subranging architecture. DATEL further enhances this technology by using a proprietary custom chip and unique laser trimming schemes. The ADC-500 and ADC-505 are packaged in a 32-pin ceramic DIP and consume 1.6 watts.

### INPUT/OUTPUT CONNECTIONS

| PIN | SIGNAL NAME        |
|-----|--------------------|
| 1   | +10V REF           |
| 2   | RANGE              |
| 3   | INPUT HIGH         |
| 4   | INPUT LOW          |
| 5   | OFFSET ADJUST      |
| 6   | NO CONNECTION      |
| 7   | COMP BIN           |
| 8   | OVERFLOW           |
| 9   | ENABLE (6-12)      |
| 10  | ENABLE (1-5, O.F.) |

| 12  | DIGITAL GROUND     |
| 13  | +15V               |
| 14  | -15V               |
| 15  | -5V                |
| 16  | ANALOG GROUND      |
| 17  | S/H CONTROL        |
| 18  | EOC                |
| 19  | BIT 12 (LSB)       |
| 20  | BIT 11             |
| 21  | BIT 10             |
| 22  | BIT 9              |
| 23  | BIT 8              |
| 24  | BIT 7              |
| 25  | BIT 6              |
| 26  | BIT 5              |
| 27  | BIT 4              |
| 28  | BIT 3              |
| 29  | BIT 2              |
| 30  | BIT 1 (MSB)        |
| 31  | START CONVERT      |
| 32  | GAIN ADJUST        |

Another novel feature of the ADC-500 is the provision of a Sample/Hold control pin for applications where a sample-hold is used in conjunction with the ADC-500. This feature allows the sample-and-hold device to go back into the sample mode a minimum of 30 nanoseconds before the conversion is complete, improving the overall conversion rate of the system.

| ABSOLUTE MAXIMUM RATINGS |         |         |          |

\* +5V power usage at 1TTL logic loading per data output bit.

① With DATEL sample and hold model number SHM-45.

## TECHNICAL NOTES

- Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 32 (ground pin 32 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (leave pin 5 open for operation without adjustment).
- Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.

- Bypass all the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 16). The -5V dc supply is treated as an analog supply and analog ground (pin 16) should be treated as its return path for decoupling purposes.
- Obtain straight binary/offset binary output coding by tying  $\overline{\text{COMP BIN}}$  (pin 7) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the  $\overline{\text{COMP BIN}}$  pin to ground. The  $\overline{\text{COMP BIN}}$  signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- An overflow signal, pin 8, indicates when analog input signals are below or above the desired full-scale range. To overflow pin also has a three-state output and is enabled by pin 10 (Enable bits 1-5 & O.F.).
- The Sample/Hold control signal, pin 17, goes low following the rising edge of  $\overline{\text{START CONVERT}}$  pulse and high 30 nanoseconds minimum before EOC goes low. This indicates that the converter can accept a new analog input.
- The drive requirements of the ADC-500/505 may be satisfied with a wide-bandwidth, low output impedance input source. Applications of these converters that require the use of a sample-and-hold may be satisfied by using DATEL's model SHM-45. Using this device with multiplexers or for test purposes will require an input buffer.

- Over temperature, input capacitance is 50 pF maximum and input impedance is 1.75K minimum (2.5K typical) for unipolar and 3.75K minimum (5K typical) for bipolar. These values are guaranteed by design.
- Requirements for  $\pm 2.5$ V inputs can be satisfied using DATEL's AM-1435 amplifier in front of the SHM-45/ADC-500 configuration, shown in Figure 3, at the appropriate gain. The SHM-45's gain of 2 mode allows 0 to +5V or  $\pm 5$ V input ranges.

**TIMING**

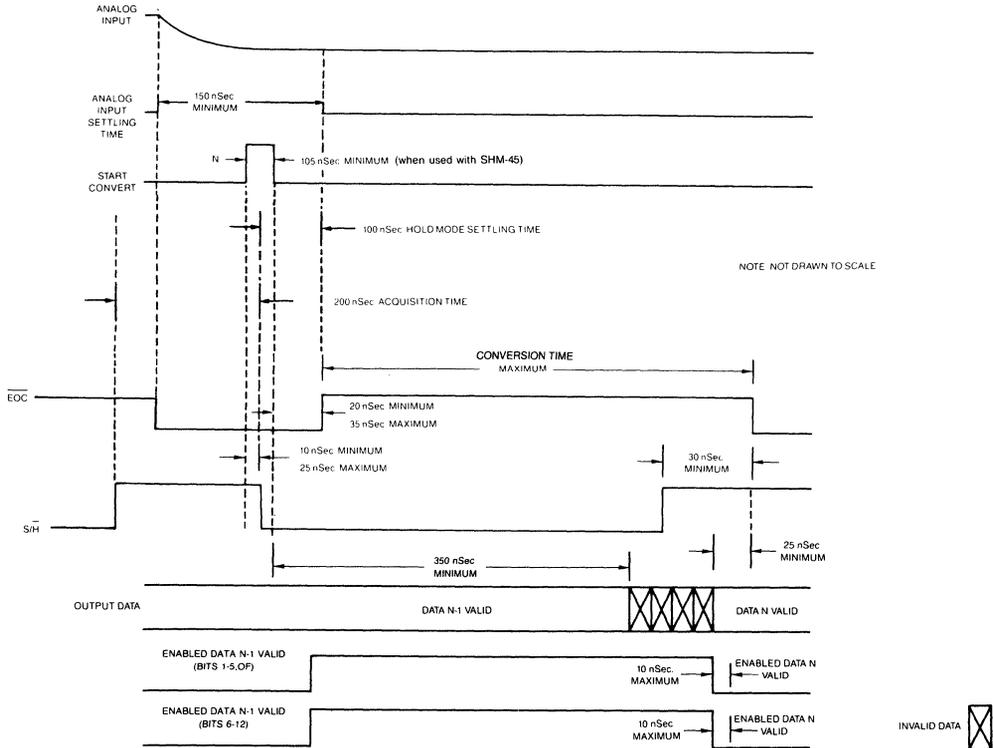

Figure 2 shows the relationship between the various input signals. The timing cited applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**TABLE 2. INPUT CONNECTIONS**

| INPUT VOLTAGE RANGE | INPUT PIN | CONNECT PIN 2 (RANGE) TO PIN: |
|---------------------|-----------|-------------------------------|
| 0 to +10V dc        | 3         | 3                             |
| 0 to +20V dc        | 3         | 16                            |
| $\pm 10$ V dc       | 3         | 1                             |

**TABLE 3. ZERO AND GAIN ADJUST**

| 0 to +10V dc  | +1.22 mV                | +9.9963V dc                   |
| 0 to +20V dc  | +2.44 mV                | +19.9927V dc                  |
| $\pm 10$ V dc | +2.44 mV                | +9.9927V dc                   |

**Figure 2. ADC-500/505 and SHM-45 Timing Diagram**

## CALIBRATION PROCEDURE

Removal of system errors or the small initial errors is accomplished as follows:

1. Connect the converter per Figure 3 and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 50 nanoseconds minimum to the START CONVERT input (pin 31) at a rate of 500 KHz. This rate chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments - Apply a precision voltage reference source between the analog input (pin 3) and ground (pin 16). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code

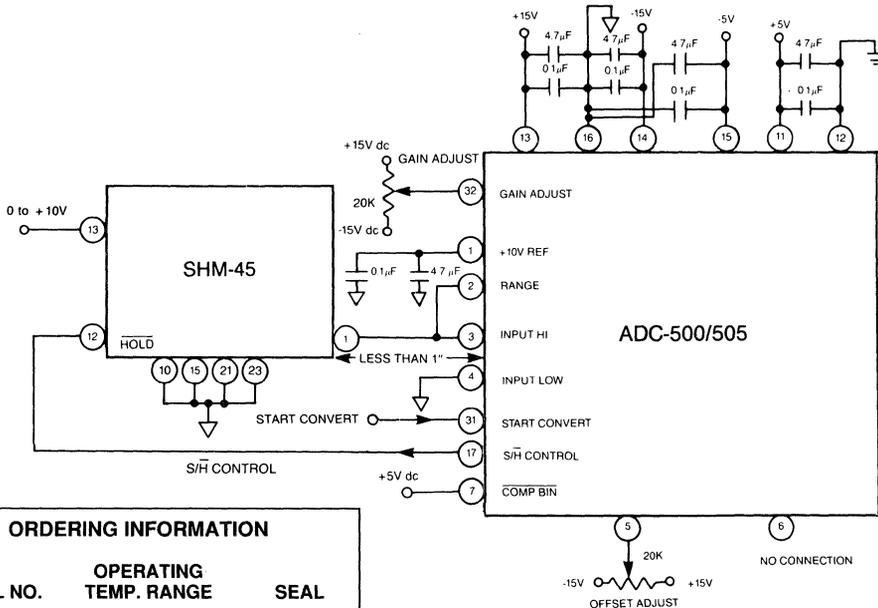

flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 7) tied high or between 1111 1111 1111 and 1111 1111 1110 with the COMP BIN tied low.

3. Full-Scale Adjustment - Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for COMP BIN (pin 7) tied high or between 0000 0000 0001 and 0000 0000 0000 for COMP BIN tied low.
4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

**TABLE 4. OUTPUT CODING**

## ORDERING INFORMATION

| MODEL NO.   | OPERATING TEMP. RANGE | SEAL     |
|-------------|-----------------------|----------|
| ADC-500BMC  | 0 to +70 °C           | Hermetic |
| ADC-500BMM  | -55 to +125 °C        | Hermetic |
| ADC-500BMC  | 0 to +70 °C           | Hermetic |
| ADC-500 BMM | -55 to +125 °C        | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-8 (Component Lead Socket), 32 required.

### FEATURES

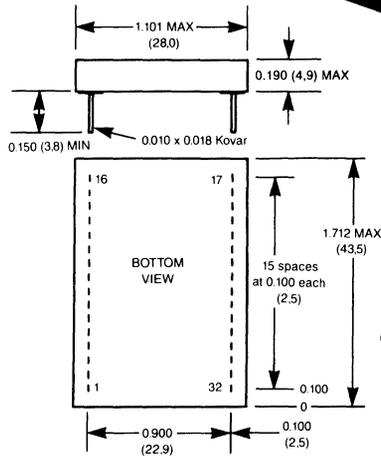

- 12-Bit resolution
- 700 Nanosecond maximum conversion time
- Low-power, 1.6W
- Small initial errors
- Three-state output buffers
- -55°C to +125°C operation
- Small 32-pin DIP
- No missing codes

### GENERAL DESCRIPTION

DATEL's ADC-508 is a 12-bit, analog-to-digital converter which has small initial errors and can also provide adjustment capability for system errors. The ADC-508 has a maximum conversion time of 700 nanoseconds. Figure 1 is a simplified block diagram.

Manufactured using thick-film and thin-film hybrid technology, this converter's remarkable performance is based upon a digitally-corrected subranging architecture. DATEL further enhances this technology by using a proprietary custom chip and unique laser trimming schemes. The ADC-508 is packaged in a 32-pin ceramic DIP and consumes 1.6 watts.

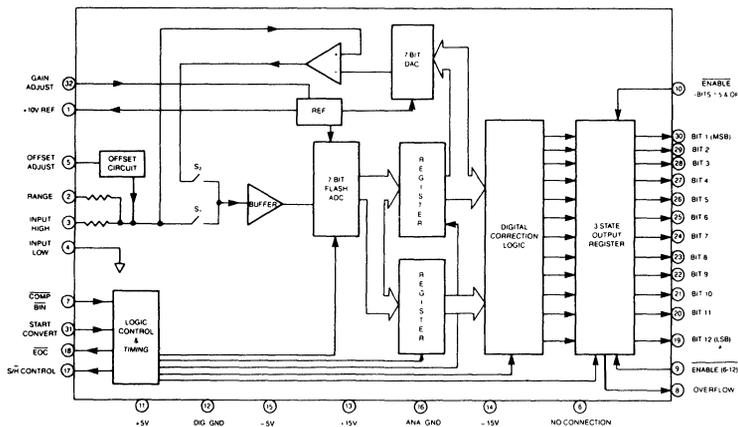

MECHANICAL DIMENSIONS  
INCHES (mm)

NOTE: Pins have 0.025 inch. ±0.01 stand off from case

### INPUT/OUTPUT CONNECTIONS

| PIN | SIGNAL NAME        |

| 20  | BIT 11             |
| 21  | BIT 10             |
| 22  | BIT 9              |
| 23  | BIT 8              |
| 24  | BIT 7              |
| 25  | BIT 6              |
| 26  | BIT 5              |
| 27  | BIT 4              |
| 28  | BIT 3              |
| 29  | BIT 2              |
| 30  | BIT 1 (MSB)        |
| 31  | START CONVERT      |
| 32  | GAIN ADJUST        |

Another novel feature of the ADC-508 is the provision of a Sample/Hold control pin for applications where a sample-hold is used in conjunction with the ADC-508. This feature allows the sample-and-hold device to go back into the sample mode a minimum of 30 nanoseconds before the conversion is complete, improving the overall conversion rate of the system.

Power required is  $\pm 15V$  dc and  $\pm 5V$  dc. Models are available in the commercial  $0^{\circ}C$  to  $+70^{\circ}C$ , and military  $-55^{\circ}C$  to  $+125^{\circ}C$  operating temperature range. Typical applications include spectrum, transient, vibration, and waveform analysis. These devices are also ideally suited for radar, sonar and video digitization, medical instrumentation, and high-speed data acquisition systems. For information

| ABSOLUTE MAXIMUM RATINGS |         |         |             |

\* +5V power usage at 1TTL logic loading per data output bit.

① With DATEL sample and hold model number SHM-45.

## TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 32 (ground pin 32 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (leave pin 5 open for operation without adjustment).
2. Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.

3. Bypass all the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 16). The -5V dc supply is treated as an analog supply and analog ground (pin 16) should be treated as its return path for decoupling purposes.
4. Obtain straight binary/offset binary output coding by tying  $\overline{\text{COMP BIN}}$  (pin 7) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the  $\overline{\text{COMP BIN}}$  pin to ground. The  $\overline{\text{COMP BIN}}$  signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. An overflow signal, pin 8, indicates when analog input signals are below or above the desired full-scale range. To overflow pin also has a three-state output and is enabled by pin 10 (Enable bits 1-5 & O.F.).
6. The Sample/Hold control signal, pin 17, goes low following the rising edge of  $\overline{\text{START CONVERT}}$  pulse and high 30 nanoseconds minimum before EOC goes low. This indicates that the converter can accept a new analog input.
7. The drive requirements of the ADC-508 may be satisfied with a wide-bandwidth, low output impedance input source. Applications of these converters that require the use of a sample-and-hold may be satisfied by using DATEL's model SHM-45. Using this device with multiplexers or for test purposes will require an input buffer.

8. Over temperature, input capacitance is 50 pF maximum and input impedance is 1.75K minimum (2.5K typical) for unipolar and 3.75K minimum (5K typical) for bipolar. These values are guaranteed by design.
9. Requirements for  $\pm 2.5$ V inputs can be satisfied using DATEL's AM-1435 amplifier in front of the SHM-45/ADC-508 configuration, shown in Figure 3, at the appropriate gain. The SHM-45's gain of 2 mode allows 0 to +5V or  $\pm 5$ V input ranges.

**TIMING**

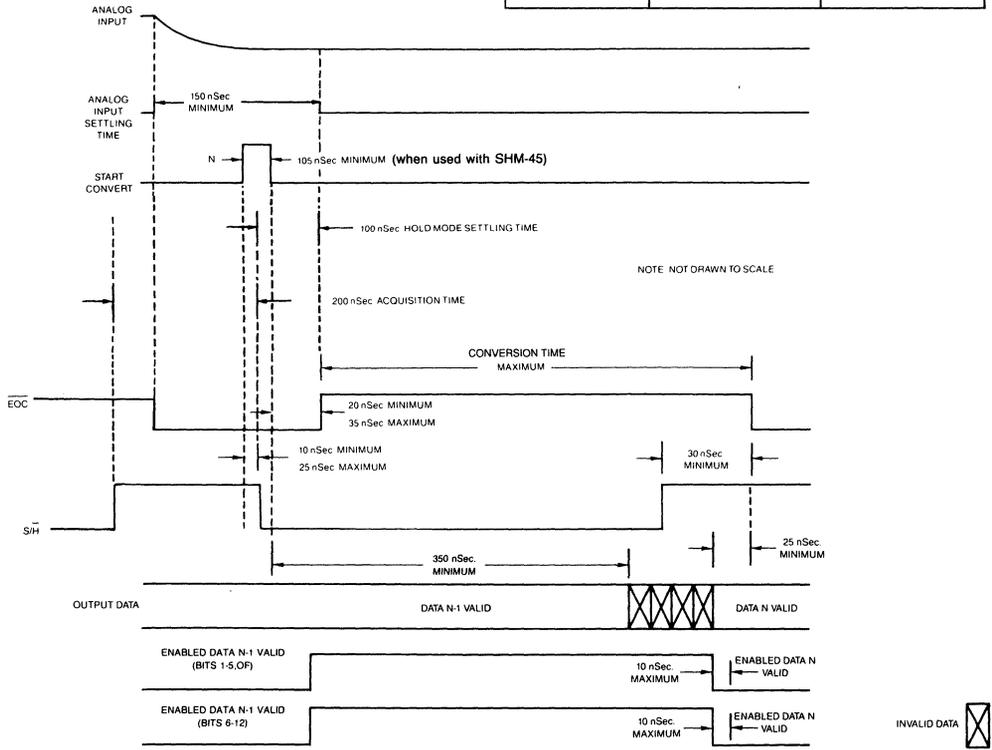

Figure 2 shows the relationship between the various input signals. The timing cited applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**TABLE 2. INPUT CONNECTIONS**

| INPUT VOLTAGE RANGE | INPUT PIN | CONNECT PIN 2 (RANGE) TO PIN: |
|---------------------|-----------|-------------------------------|
| 0 to +10V dc        | 3         | 3                             |
| 0 to +20V dc        | 3         | 16                            |
| $\pm 10$ V dc       | 3         | 1                             |

**TABLE 3. ZERO AND GAIN ADJUST**

| FSR           | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>+FS -1/2 LSB |
|---------------|-------------------------|-----------------------------|
| 0 to +10V dc  | +1.22 mV                | +9.9963V dc                 |
| 0 to +20V dc  | +2.44 mV                | +19.9927V dc                |
| $\pm 10$ V dc | +2.44 mV                | +9.9927V dc                 |

## CALIBRATION PROCEDURE

Removal of system errors or the small initial errors is accomplished as follows:

1. Connect the converter per Figure 3 and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 50 nanoseconds minimum to the START CONVERT input (pin 31) at a rate of 500 KHz. This rate chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments - Apply a precision voltage reference source between the analog input (pin 3) and ground (pin 16). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 7) tied high or between 1111 1111 1111 and 1111 1111 1110 with the COMP BIN tied low.
3. Full-Scale Adjustment - Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for COMP BIN (pin 7) tied high or between 0000 0000 0001 and 0000 0000 0000 for COMP BIN tied low.
4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

## ORDERING INFORMATION

| MODEL NO.  | OPERATING TEMP. RANGE | SEAL     |
|------------|-----------------------|----------|
| ADC-508BMC | 0 to +70 °C           | Hermetic |
| ADC-508BMM | -55 to +125 °C        | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-8 (Component Lead Socket), 32 required.

### FEATURES

- 12-Bit resolution
- 1.0 Microsecond maximum conversion time
- Low-power, 925 milliwatts
- Three-state, output buffers
- Functionally complete
- Small 24-pin DIP
- No missing codes

### GENERAL DESCRIPTION

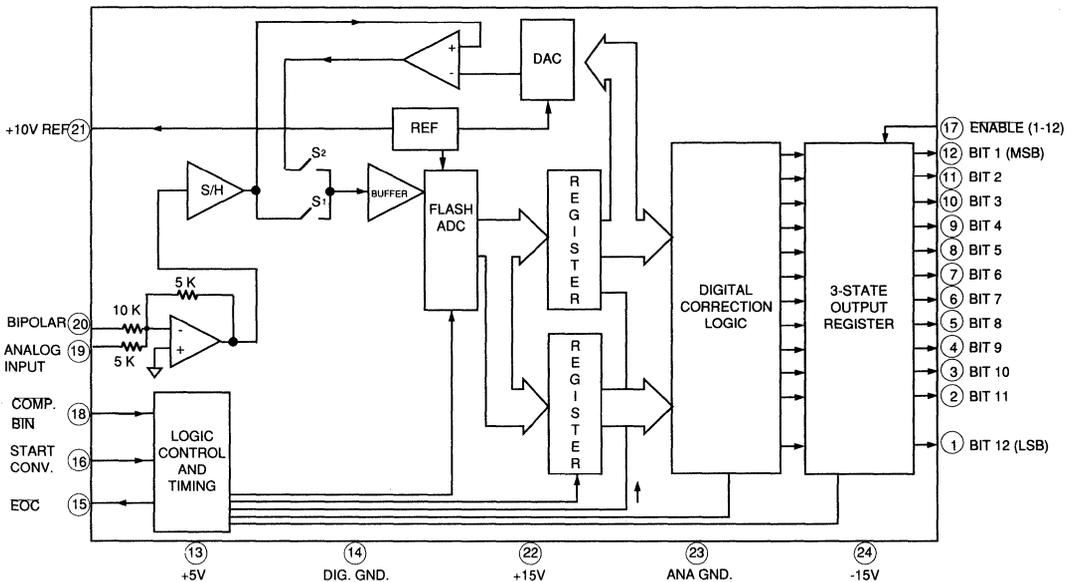

DATEL's ADC-511 uses an advanced design to provide a high-speed, functionally complete 12-bit A/D converter in a small 24-pin DIP. The ADC-511 delivers a conversion speed of 1 microsecond while consuming only 925 milliwatts of power.

Manufactured using thin- and thick-film hybrid technology, the ADC-511's exclusive performance is based upon a digitally-corrected subranging architecture. DATEL further enhances this technology by using a proprietary custom chip and unique laser trimming schemes.

Functionally complete, the ADC-511 contains an internal clock, three-state outputs and an internal reference.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION        |
|-----|------------------|-----|-----------------|
| 1   | BIT 12 OUT (LSB) | 13  | +5V             |
| 2   | BIT 11 OUT       | 14  | DIGITAL GROUND  |
| 3   | BIT 10 OUT       | 15  | EOC             |
| 4   | BIT 9 OUT        | 16  | START CONVERT   |
| 5   | BIT 8 OUT        | 17  | ENABLE (1 - 12) |
| 6   | BIT 7 OUT        | 18  | COMP BIN        |
| 7   | BIT 6 OUT        | 19  | ANALOG INPUT    |
| 8   | BIT 5 OUT        | 20  | BIPOLAR         |
| 9   | BIT 4 OUT        | 21  | +10V REF        |
| 10  | BIT 3 OUT        | 22  | +15V            |
| 11  | BIT 2 OUT        | 23  | ANALOG GROUND   |
| 12  | BIT 1 OUT (MSB)  | 24  | -15V            |

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                              | LIMITS     | UNITS    |
|---|------------|----------|
| +15V Supply (Pin 22)                    | 0 to +18   | Volts dc |
| -15V Supply (Pin 24)                    | 0 to -18   | Volts dc |
| +5V Supply(Pin 13)                      | -0.5 to +7 | Volts dc |
| Digital inputs<br>(Pins 16, 17, and 18) | -0.3 to +7 | Volts dc |
| Analog input                            | -25 to +25 | Volts dc |
| Lead temp. (10 sec.)                    | 300        | ° C max. |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and ±5V dc unless otherwise specified.

① Specifications cited are at +25 °C. See Technical Note 1 for further information.  
 ② +5V power usage at 1 TTL logic loading per data output bit.

TECHNICAL NOTES

- Applications unaffected by endpoint errors or those that remove them through software will use the typical connections shown in Figure 2. The optional external circuitry of Figure 4 removes system errors or helps adjust the small initial errors of the ADC-511 to zero. The external adjustment circuit has no effect on the throughput rate. Table 1 shows how to select the input range.
- Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. This prevents contamination of the analog ground by noisy digital ground currents.
- Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7µF, 25V tantalum electrolytic capacitor in parallel with a 0.1µF ceramic capacitor. Bypass the +10V reference (pin 21) to analog ground (pin 23).
- Obtain straight binary/offset binary output coding by tying COMP BIN (pin 18) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie pin 18 to ground. The complementary signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- To obtain Three-State outputs, connect ENABLE (pin 17) to a logic "0" (low). Otherwise, connect pin 17 to a logic "1" (high).

TIMING

Figure 3 shows the relationship between the various input signals. The timing shown applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

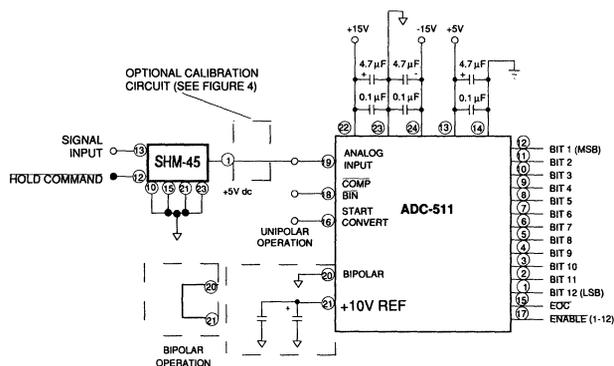

Figure 2. Typical Input Connections for the ADC-511

CALIBRATION

- The data outputs should be connected to LED's to observe the resulting data values. Connect the converter per Figure 2, Figure 4, and Table 1 for the appropriate Full Scale Range (FSR). Apply a pulse of 200 nanoseconds minimum to the START CONVERT input (pin 16) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
- Zero Adjustments  
Apply a precision voltage reference source between the amplifier's signal input and analog ground. Use a very low-noise signal source for accurate calibration.  
  
Adjust the output of the reference source per Table 4. For unipolar operation, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 18) tied high or between 1111 1111 1111 and 1111 1111 1110 with pin 18 tied low.  
  
For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with pin 18 tied high or between 0111 1111 1111 and 0111 1111 1110 with pin 18 tied low.
- Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 4. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for pin 18 tied high or between 0000 0000 0001 and 0000 0000 0000 for pin 18 tied low.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 6.

NOTE: Pins have a 0.025 Inch,  $\pm$ 0.01 standoff from case.

**ORDERING INFORMATION**

| MODEL        | TEMPERATURE RANGE | SEAL     |
|--------------|-------------------|----------|
| ADC-511MC    | 0 °C to +70 °C    | Hermetic |
| ADC-511MM    | -55 °C to +125 °C | Hermetic |
| ADC-511/883B | -55 °C to +125 °C | Hermetic |

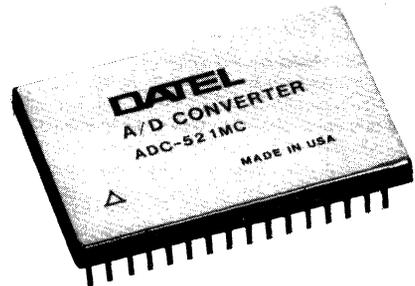

A receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-8 (Component Lead Socket), 24 required.

# ADC-520, ADC-521

## 12-Bit, Ultra-Fast, Low-Power A/D Converters

### FEATURES

- 12-Bit resolution
- 800 Nanosecond maximum conversion time
- Pin-programmable input ranges
- Internal high impedance buffer
- Low 1.6 watts power consumption
- Three-state output buffers
- Small 32-pin DIP
- No missing codes

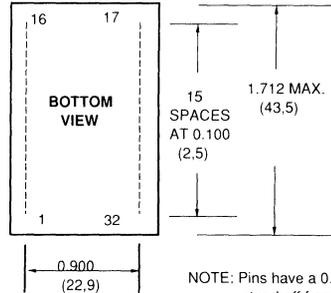

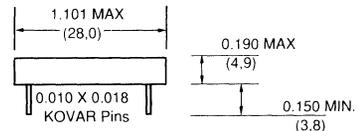

### GENERAL DESCRIPTION

DATEL's ADC-520 and ADC-521 are 12-bit analog-to-digital converters with conversion speeds of up to 800 nanoseconds. Both models are identical except for the analog input voltage ranges.

The performance of these converters is based upon a digitally-correcting subranging architecture. DATEL further enhances this technology by using unique laser trimming schemes. The ADC-520 and ADC-521 are packaged in a 32-pin ceramic DIP and consume 1.6 watts.

### MECHANICAL DIMENSIONS INCHES (mm)

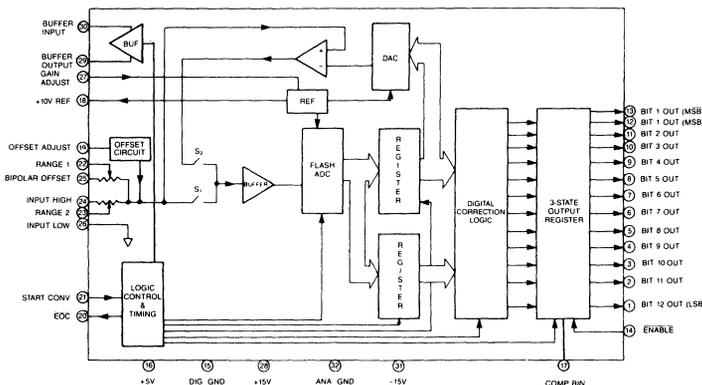

NOTE: Pins have a 0.025 inch,  $\pm 0.01$  stand-off from case.

### TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K ohm trimming potentiometer for gain adjustment with the wiper tied to pin 27 (ground pin 27 for operation without adjustments). Use a 20K ohm trimming potentiometer with the wiper tied to pin 19 for zero/offset adjustment (leave pin 19 open for operation without adjustment).

### I/O CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION           |
|-----|------------------|-----|--------------------|
| 1   | BIT 12 OUT (LSB) | 17  | COMP BIN           |
| 2   | BIT 11 OUT       | 18  | REF. OUT (+10V dc) |
| 3   | BIT 10 OUT       | 19  | OFFSET ADJUST      |
| 4   | BIT 9 OUT        | 20  | EOC                |
| 5   | BIT 8 OUT        | 21  | START CONVERT      |
| 6   | BIT 7 OUT        | 22  | RANGE 1            |
| 7   | BIT 6 OUT        | 23  | RANGE 2            |
| 8   | BIT 5 OUT        | 24  | INPUT HIGH         |
| 9   | BIT 4 OUT        | 25  | BIPOLAR OFFSET     |
| 10  | BIT 3 OUT        | 26  | INPUT LOW          |
| 11  | BIT 2 OUT        | 27  | GAIN ADJUST +15V   |
| 12  | BIT 1 OUT (MSB)  | 28  | +15V               |
| 13  | BIT 1 OUT (MSB)  | 29  | BUFFER OUTPUT      |
| 14  | ENABLE           | 30  | BUFFER INPUT       |
| 15  | DIGITAL GROUND   | 31  | -15V               |
| 16  | +5V              | 32  | ANALOG GROUND      |

- Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
- Bypass all the analog and digital supplies and the +10V reference (pin 18) to ground with a 4.7  $\mu\text{F}$ , 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu\text{F}$  ceramic capacitor. Bypass the +10V reference (pin 18) to analog ground (pin 32) the same way.
- Obtain straight binary/offset binary output coding by tying  $\overline{\text{COMP BIN}}$  (pin 7) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the  $\overline{\text{COMP BIN}}$  pin to ground. In the bipolar mode, two's complement output coding is available by using the MSB output (pin 13). The  $\overline{\text{COMP BIN}}$  signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- Enable the three-state outputs by connecting  $\overline{\text{ENABLE}}$  (pin 14) to a logic 0 (low). The ENABLE signal has no effect on MSB (pin 13) which is not a three-state output and therefore is not controlled by the enable pin.
- Satisfy high-speed drive requirements of the ADC-520, -521 with a wide-bandwidth, low output impedance input source such as DATEL's SHM-45 sample-and-hold or AM-1435 amplifier.
- The ADC-520, -521 provide an internal buffer amplifier. Using this buffer provides an input impedance of  $10^{12}$  ohms, allowing the A/D to be driven from a high impedance source or directly from an analog multiplexer. When using the input buffer, allow a delay equal to its settling time between input level change and the negative going edge of the START CONVERT pulse. If the buffer is not required, its input should be connected to analog ground to avoid introducing noise into the converter.

## ABSOLUTE MAXIMUM RATINGS

| PARAMETERS                          | LIMITS       | UNITS              |
|-------------------------------------|--------------|--------------------|
| +15V Supply (Pin 28)                | 0 to +18     | Volts dc           |
| -15V Supply (Pin 31)                | 0 to -18     | Volts dc           |
| +5V Supply (Pin 16)                 | -0.5 to +7.0 | Volts dc           |
| Digital Inputs<br>(Pins 14, 17, 21) | -0.3 to +6.0 | Volts dc           |
| Analog Input (Pin 24)               | -15 to +15   | Volts dc           |
| Lead Temp.(10 Sec.)                 | 300          | $^{\circ}\text{C}$ |

## FUNCTIONAL SPECIFICATIONS

The following specifications apply over the operating temperature range and at  $\pm 15\text{V}$  dc and +5V dc unless otherwise specified.

| ANALOG INPUTS            | MIN. | TYP.      | MAX. | UNITS    |

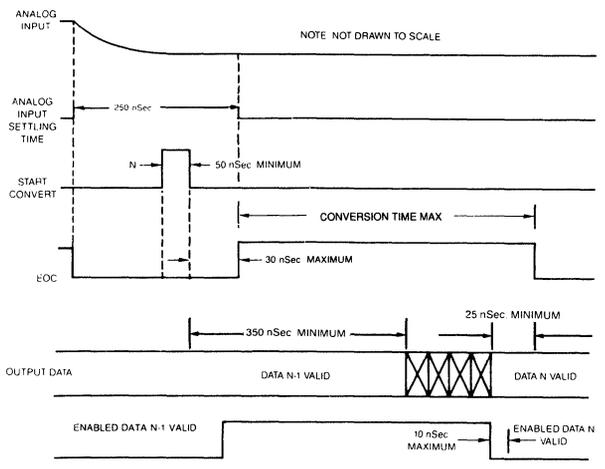

Figure 2. ADC-520, ADC-521 Timing Diagram

**TIMING**

Figure 2 shows the relationship between the various input signals. The timing cited applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 3 and Tables 2a and 2b for the appropriate full-scale range (FSR). Apply a pulse of 50 nanoseconds minimum to the START CONVERT input (pin 21) at a rate of 500 KHz. This rate reduces flicker if LED's are used on the outputs for calibration purposes.
  2. Zero Adjustments - Apply a precision voltage reference source between the analog input and ground. Refer to Tables 2a and 2b for the correct input pin. Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 17) tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with the COMP BIN tied low (complementary binary).
- For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 17) tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with COMP BIN (pin 17) tied low (complementary offset binary).

Two's complement and complementary two's complement requires the use of MSB (pin 13) versus MSB (pin 12) as given for offset binary or complementary offset binary respectively.

- Full-Scale Adjustment - Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for COMP BIN (pin 17) tied high or between 0000 0000 0001 and 0000 0000 0000 for COMP BIN tied low. Two's complement and complementary two's complement respectively requires using MSB, pin 13.
- To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Tables 4 and 5.

**Table 3. Zero and Gain Adjust**

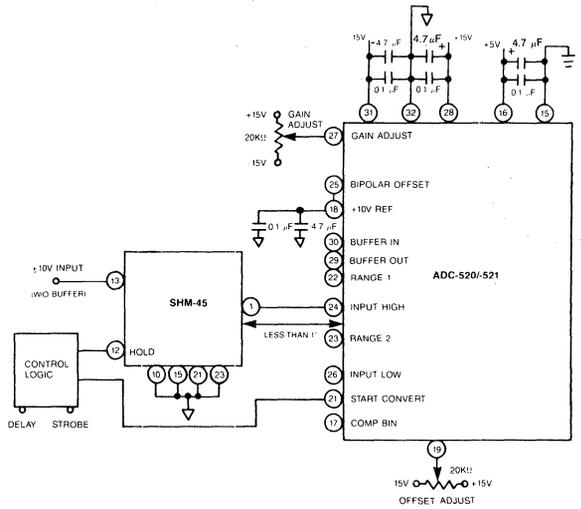

| FSR          | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>+FS -1 1/2 LSB |
|--------------|-------------------------|-------------------------------|
| 0 to +5V     | +0.610 mV dc            | +4.9971V dc                   |

### ORDERING INFORMATION

| MODEL NO. | OPERATING TEMP. RANGE |
|-----------|-----------------------|
| ADC-520MC | 0 to +70 °C           |
| ADC-521MC | 0 to +70 °C           |

Order PC board mounting receptacle through AMP Inc. part #3-33127-8 (Component Lead Socket), 32 required.

### FEATURES

- 12-Bit resolution
- 350 Nanoseconds maximum conversion time
- Low-power, 2.1W
- Small initial errors
- Three-state output buffers
- -55 to +125 °C operation
- Small 32-pin DIP
- No missing codes

### GENERAL DESCRIPTION

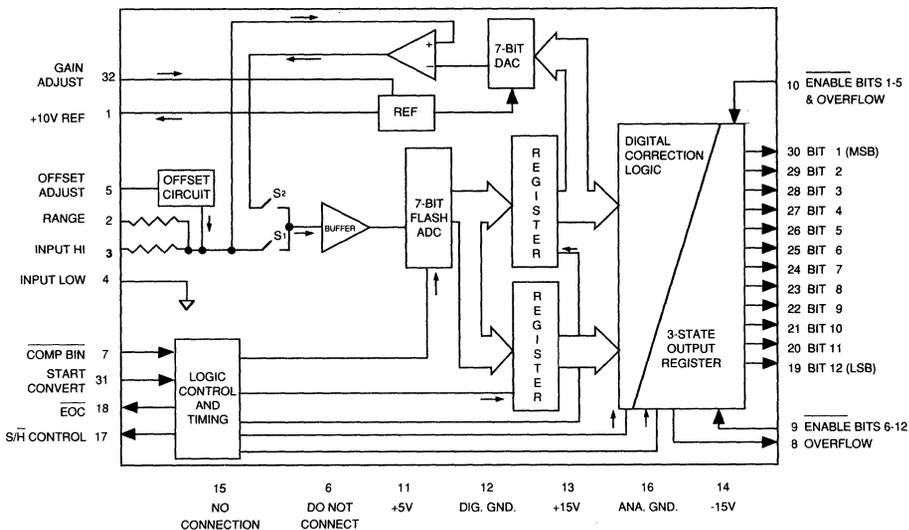

DATEL's ADC-530 reflects the ultimate in state-of-the-art analog signal conversion technology. The ADC-530 boasts a conversion speed of 350 nanoseconds, along with a low-power consumption of 2.1 watts.

DATEL's ADC-530 is a 12-bit analog-to-digital converter which has small initial errors and can also provide adjustment capability for system errors. The ADC-530 has a maximum conversion time of 350 nanoseconds.

Manufactured using thick-film and thin-film hybrid technology, this converter's remarkable performance is based upon a digitally-corrected subranging architecture. DATEL further enhances this technology by using a proprietary custom chip and unique laser trimming schemes. The ADC-530 is packaged in a 32-pin ceramic DIP.

### INPUT/OUTPUT CONNECTIONS

| PIN | SIGNAL NAME                  | PIN | SIGNAL NAME      |

| 13  | +15V                         | 29  | BIT 2 OUT        |
| 14  | -15V                         | 30  | BIT 1 OUT (MSB)  |
| 15  | NO CONNECTION                | 31  | START CONVERT    |
| 16  | ANALOG GROUND                | 32  | GAIN ADJUST      |

All digital inputs and three-state outputs are TTL- and CMOS-compatible. Output coding can be in straight binary/offset binary or complementary binary/complementary offset binary by using the COMP BIN pin. An overflow pin indicates when inputs are below or above the normal full-scale range.

A novel feature of the ADC-530 is the provision of a Sample/Hold control pin for applications where a sample-hold is used in conjunction with the ADC-530. This feature allows the sample-and-hold device to go back into the sample mode a minimum of 30 nanoseconds before the conversion is complete, improving the overall conversion rate of the system.

### ABSOLUTE MAXIMUM RATINGS

|                                   |                |
|-----------------------------------|----------------|
| <b>+15V Supply (Pin 13)</b>       | 0 to +18V dc   |
| <b>-15V Supply (Pin 14)</b>       | 0 to -18V dc   |
| <b>+5V Supply (Pin 11)</b>        | -0.5 to +7V dc |
| <b>Digital Inputs</b>             |                |
| (Pins 7, 9, 10, & 31)             | -0.3 to +6V dc |
| <b>Analog Input (Pin 3)</b>       | -15 to +15V dc |
| <b>Lead temperature (10 Sec.)</b> | 300 °C max.    |

### FUNCTIONAL SPECIFICATIONS

Apply over the operating temperature range and at  $\pm 15V$  dc and +5V power supply voltages unless otherwise specified.

\*+5V power usage at 1 TTL logic loading per data output bit.

### TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 32 (ground pin 32 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (leave pin 5 open for operation without adjustment).
2. Rated performance requires using good high frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass all the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7  $\mu F$ , 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu F$  ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 16).

- Obtain straight binary/offset binary output coding by tying COMP BIN (pin 7) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding tie the COMP BIN pin to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
- An overflow signal, pin 8, indicates when analog input signals are below or above the desired full-scale range. The overflow pin also has a three-state output and is enabled by pin 10 (ENABLE bits 1-5 & O.F.).
- The sample-and-hold (S/H) control signal, pin 17, goes low following the rising edge of a start convert pulse and high 30 nanoseconds minimum before EOC goes low. This indicates that the converter can accept a new analog input.
- The drive requirements of the ADC-530 may be satisfied with a wide-bandwidth, low output impedance input source. Applications of these converters that require the use of a sample-and-hold may be satisfied by using DATEL's model SHM-45. Using this device with multiplexers or for test purposes will require an input buffer.
- Over temperature, input capacitance is 50 pF maximum and input impedance is 1.75K minimum (2.5K typical) for 0 to +10V and 3.75K minimum (5K typical) for 0 to +20V, ±10V. These values are guaranteed by design.
- Requirements for ±2.5V inputs can be satisfied using DATEL's AM-1435 amplifier in front of the SHM-45/ADC-530 configuration, shown in Figure 3, at the appropriate gain. The SHM-45's gain of 2 mode allows 0 to +5V or ±5V input ranges.

**CALIBRATION PROCEDURE**

- Connect the converter per Figure 3 and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 100 nanoseconds minimum to the START CONVERT input (pin 31) at a rate of 500 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
- Zero Adjustments  
Apply a precision voltage reference source between the analog input (pin 3) and ground (pin 16). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 7) tied high or between 1111 1111 1111 and 1111 1111 1110 with pin 7 tied low.  
  
For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with pin 7 tied high or between 0111 1111 1111 and 0111 1111 1110 with pin 7 tied low.
- Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for pin 7 tied high or between 0000 0000 0001 and 0000 0000 0000 for pin 7 tied low.
- To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

**TIMING**

Figure 2 shows the relationship between the various input signals. The timing cited applies over the operating temperature range and over the operating power supply range. These times are guaranteed by design.

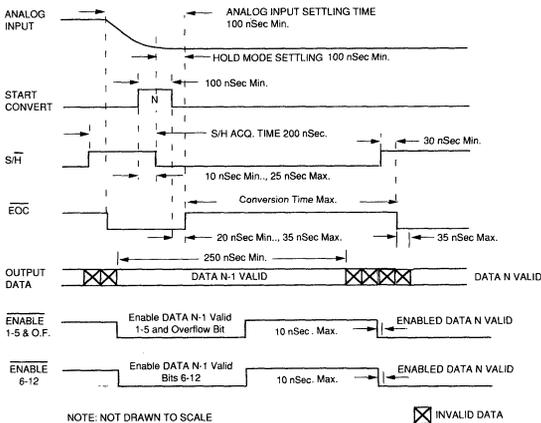

Figure 2. ADC-530 and SHM-45 Timing Diagram

Table 2. Input Connections

| INPUT VOLTAGE RANGE | INPUT PIN | CONNECT PIN 2 (RANGE) TO PIN: |
|---------------------|-----------|-------------------------------|
| 0 to +10V dc        | 3         | 3                             |
| 0 to +20V dc        | 3         | 16                            |

MECHANICAL DIMENSIONS INCHES (MM)

NOTE: Pins have a 0.025 inch, ±0.01 stand-off from case.

ORDERING INFORMATION

| MODEL      | OPERATING TEMP. RANGE | SEAL     |
|------------|-----------------------|----------|
| ADC-530 MC | 0 to +70 °C           | Hermetic |
| ADC-530 MM | -55 to +125 °C        | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-8 (Component Lead Socket), 32 required.

For availability of MIL-STD-883B versions, contact DATEL.

### FEATURES

- 14-Bit resolution
- 1.0  $\mu$ Sec. conversion time
- Functionally complete
- Small 32-pin DIP
- Low-power, 2.9 Watts maximum
- Three-state output buffers
- No missing codes

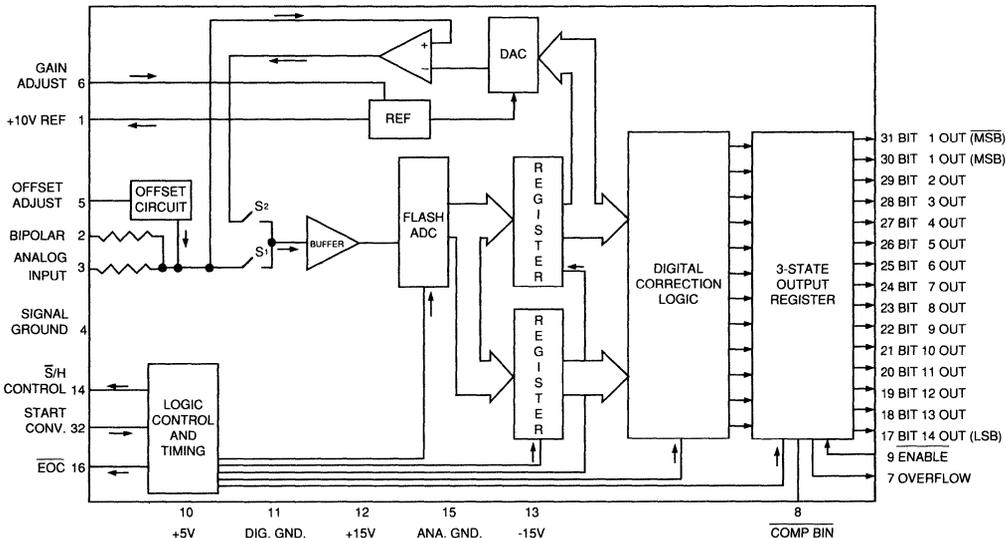

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION       | PIN | FUNCTION         |

### GENERAL DESCRIPTION

DATEL's ADC-908 is a 14-bit, 1.0 microsecond conversion time, functionally complete A/D converter.

Packaged in a small 32-pin DIP, power requirements are  $\pm 15$  volts and +5 volts with a 2.9 Watts maximum power dissipation.

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                               | LIMITS       | UNITS    |
|--|--------------|----------|
| +15V Supply (Pin 12)                     | -0.3 to +18  | Volts dc |
| -15V Supply (Pin 13)                     | +0.3 to -18  | Volts dc |
| +5V Supply (Pin 10)                      | -0.3 to +7.0 | Volts dc |
| <b>Digital Inputs</b><br>(Pins 8, 9, 32) | -0.3 to +7.0 | Volts dc |
| <b>Analog Input (Pin 3)</b>              | ±25          | Volts    |
| <b>Lead Temp. (10 Sec.)</b>              | 300 max.     | °C       |

**FUNCTIONAL SPECIFICATIONS**

Apply over the operating temperature range and at ±15V dc and +5V dc power supply voltages unless otherwise specified.

\* +5V power usage at 1 TTL logic loading per data output bit.  
Specifications subject to change without notice.

TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 6 (ground pin 6 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 5 for zero/offset adjustment (ground pin 5 for operation without adjustment).
2. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the digital and analog grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
3. Bypass the analog and digital supplies and the +10V reference (pin 1) to ground with a 4.7 μF, 25V tantalum electrolytic capacitor in parallel with a 0.1 μF ceramic capacitor. Bypass the +10V reference (pin 1) to analog ground (pin 15).
4. Obtain straight binary/offset binary or 2's complement output coding by tying COMP BIN (pin 8) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary, complementary offset binary, or complementary 2's complement output coding, tie pin 8 to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.
5. To enable the three-state outputs, connect ENABLE (pin 9) to a logic "0" (low). To disable, connect pin 9 to a logic "1" (high).

6. The SAMPLE/HOLD CONTROL, pin 14, is low on power-up. The START CONVERT pulse should be given at a time delay equal to the desired acquisition time minus the 10 nanosecond delay from START CONVERT high to S/H CONTROL high. This assures the sample-hold has the minimum required acquisition time for the particular application mode.

The SAMPLE/HOLD CONTROL pin goes high following the rising edge of a START CONVERT pulse and low 30 nanoseconds minimum before EOC goes low. This indicates the converter can accept a new analog input.

7. Retriggering the START CONVERT pulse before EOC goes low will not initiate a new conversion.

Table 1. Input Connections

| INPUT RANGE | INPUT PIN | TIE TOGETHER |
|-------------|-----------|--------------|
| 0 to +10V   | Pin 3     | Pins 2 and 4 |
| 0 to +20    | Pin 2     | Pins 3 and 4 |
| ±5V         | Pin 3     | Pins 2 and 1 |

Table 2. Zero and Gain Adjust

| FSR       | ZERO ADJUST<br>+1/2 LSB | GAIN ADJUST<br>FS - 1/2 LSB |
|-----------|-------------------------|-----------------------------|
| 0 to +10V | +305 μV                 | +9.999085V                  |
| 0 to +20V | +610 μV                 | +19.99817V                  |
| ±5V       | +305 μV                 | +4.999085V                  |

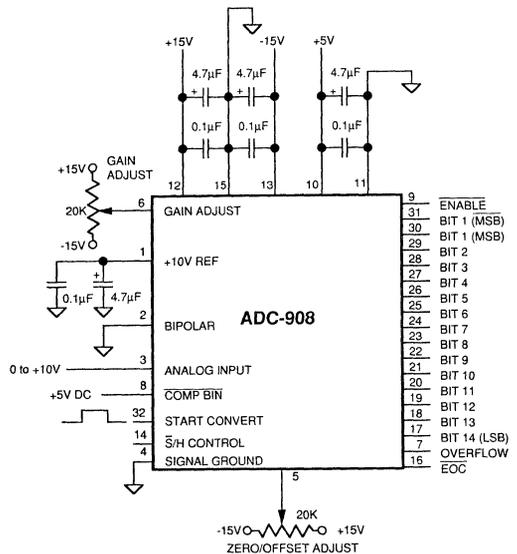

Figure 3. Typical ADC-908 Connection Diagram

## CALIBRATION PROCEDURE

1. Connect the converter per Figure 3, and Table 1 for the appropriate full-scale range (FSR). Apply a pulse of 200 nano-seconds minimum to the START CONVERT input (pin 31) at a rate of 250 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.
2. Zero Adjustments  
Apply a precision voltage reference source between the analog input (pin 3) and ground (pin 4). Adjust the output of the reference source per Table 2.

For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 00 0000 0000 0000 and 00 0000 0000 0001 with the COMP BIN (pin 8) tied high (straight binary) or between 11 1111 1111 1111 and 11 1111 1111 1110 with pin 8 tied low (complementary binary).

**Table 3. Output Coding for Unipolar Operation**

| UNIPOLAR SCALE | INPUT RANGE (Volts) |           | OUTPUT CODING     |                   |                   |                   |
|----------------|---------------------|-----------|-------------------|-------------------|-------------------|-------------------|
|                | 0 to +10V           | 0 to +20V | STRAIGHT BIN.     |                   | COMP. BINARY      |                   |
|                |                     |           | MSB               | LSB               | MSB               | LSB               |
| +FS-1LSB       | +9.99939            | +19.99878 | 11 1111 1111 1111 | 00 0000 0000 0000 | 00 0000 0000 0000 | 00 0000 0000 0000 |
| 7/8 FS         | +8.7500             | +17.500   | 11 1000 0000 0000 | 00 0111 1111 1111 | 00 0111 1111 1111 | 00 0111 1111 1111 |

| 1/2 FS         | +5.0000             | +10.000   | 10 0000 0000 0000 | 01 1111 1111 1111 | 01 1111 1111 1111 | 01 1111 1111 1111 |
| 1/4 FS         | +2.5000             | +5.0000   | 01 0000 0000 0000 | 10 1111 1111 1111 | 10 1111 1111 1111 | 10 1111 1111 1111 |
| 1/8 FS         | +1.2500             | +2.5000   | 00 1000 0000 0000 | 11 0111 1111 1111 | 11 0111 1111 1111 | 11 0111 1111 1111 |
| 1 LSB          | +0.00061            | +0.00122  | 00 0000 0000 0001 | 11 1111 1111 1110 | 11 1111 1111 1110 | 11 1111 1111 1110 |
| 0              | 0.0000              | 0.0000    | 00 0000 0000 0000 | 11 1111 1111 1111 | 11 1111 1111 1111 | 11 1111 1111 1111 |

For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001 with pin 8 tied high (offset binary) or between 01 1111 1111 1111 and 01 1111 1111 1110 with pin 8 tied low (complementary offset binary).

Two's complement coding requires use of the MSB (pin 31) with pin 8 tied high, adjusting the potentiometer such that the code flickers between 00 0000 0000 0000 and 00 0000 0000 0001.

3. Full-Scale Adjustment  
Set the output of the voltage reference used in step 2 to the value shown in Table 2.

Adjust the gain trimming potentiometer so that the output code flickers equally between 11 1111 1111 1110 and 11 1111 1111 1111 with pin 8 tied high (straight binary) or between 00 0000 0000 0000 and 00 0000 0000 0001 pin 8 tied low (complementary binary).

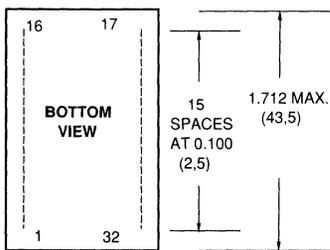

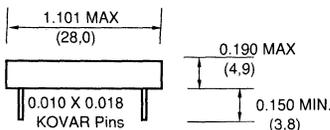

Two's complement coding requires use of the MSB (pin 31) with the pin 8 tied high, adjusting the gain trimming potentiometer so that the output code flickers equally between 01 1111 1111 1110 and 01 1111 1111 1111.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Tables 3 and 4.

**Table 4. Output Coding for Bipolar Operation**

| BIPOLAR SCALE | INPUT RANGE (Volts) ±5V | OUTPUT CODING     |                   |                   |                   |                   |                   |

### MECHANICAL DIMENSIONS INCHES (MM)

NOTE: Pins have a 0.025 inch, ±0.01 stand-off from case.

### ORDERING INFORMATION

| MODEL NUMBER | OPERATING TEMP. RANGE | SEAL     |
|--------------|-----------------------|----------|
| ADC-908MC    | 0 °C to +70 °C        | Hermetic |
| ADC-908MM    | -55 °C to +125 °C     | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 32 required.

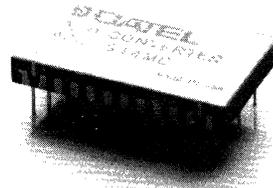

For availability of MIL-STD-883 versions, contact DATEL.

# ADC-914

## 14-Bit, High-Speed, Low-Power A/D Converter

### FEATURES

- 14-Bit resolution
- 2.4 Microsecond maximum conversion time
- Low-power, 925 milliwatts
- Three-state output buffers
- Functionally complete
- Small 24-pin DIP

### GENERAL DESCRIPTION

DATEL's ADC-914 uses an advanced design to provide a high-speed, functionally complete 14-bit A/D converter in a small 24-pin DIP. The ADC-914 delivers a conversion speed of 2.4 microsecond while consuming only 925 milliwatts of power.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION         | PIN | FUNCTION      |
|-----|------------------|-----|---------------|
| 1   | BIT 14 OUT (LSB) | 13  | +5V           |
| 2   | BIT 13 OUT       | 14  | ENABLE        |
| 3   | BIT 12 OUT       | 15  | EOC           |
| 4   | BIT 11 OUT       | 16  | START CONVERT |
| 5   | BIT 10 OUT       | 17  | BIT 2 OUT     |
| 6   | BIT 9 OUT        | 18  | BIT 1 (MSB)   |
| 7   | BIT 8 OUT        | 19  | ANALOG INPUT  |
| 8   | BIT 7 OUT        | 20  | BIPOLAR       |
| 9   | BIT 6 OUT        | 21  | +10V REF      |
| 10  | BIT 5 OUT        | 22  | +15V          |
| 11  | BIT 4 OUT        | 23  | GROUND        |
| 12  | BIT 3 OUT (MSB)  | 24  | -15V          |

① +5V power usage at 1 TTL logic loading per data output bit.

## TECHNICAL NOTES

- Applications unaffected by endpoint errors or those that remove them through software will use the typical connections shown in Figure 2. The optional external circuitry of Figure 4 removes system errors or helps adjust the small initial errors of the ADC-914 to zero. The external adjustment circuit has no effect on the throughput rate. Table 1 shows how to select the input range.
- Bypass the analog and digital supplies and the +10V reference (pin 21) to ground with a 4.7 µF, 25V tantalum electrolytic capacitor in parallel with a 0.1 µF ceramic capacitor. Bypass the +10V reference (pin 21) to ground (pin 23).

**CALIBRATION**

1. Apply a pulse 200 nanoseconds minimum to the START CONVERT input (pin 16) at a rate of 250 KHz. That rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

Connect the converter per Figure 2, Figure 4, and Table 1 for the appropriate full scale range (FSR).

2. Zero Adjustments:

Apply a precision voltage reference source between the amplifier's signal input and analog ground. Use a very low-noise signal source for accurate calibration.

Adjust the output of the reference source per Table 4. For unipolar operation, adjust the zero trimming potentiometer so that the output code flickers between 00 0000 0000 0000 and 00 0000 0000 0001. For bipolar operation, adjust the potentiometer such that the code flickers equally between 10 0000 0000 0000 and 10 0000 0000 0001.

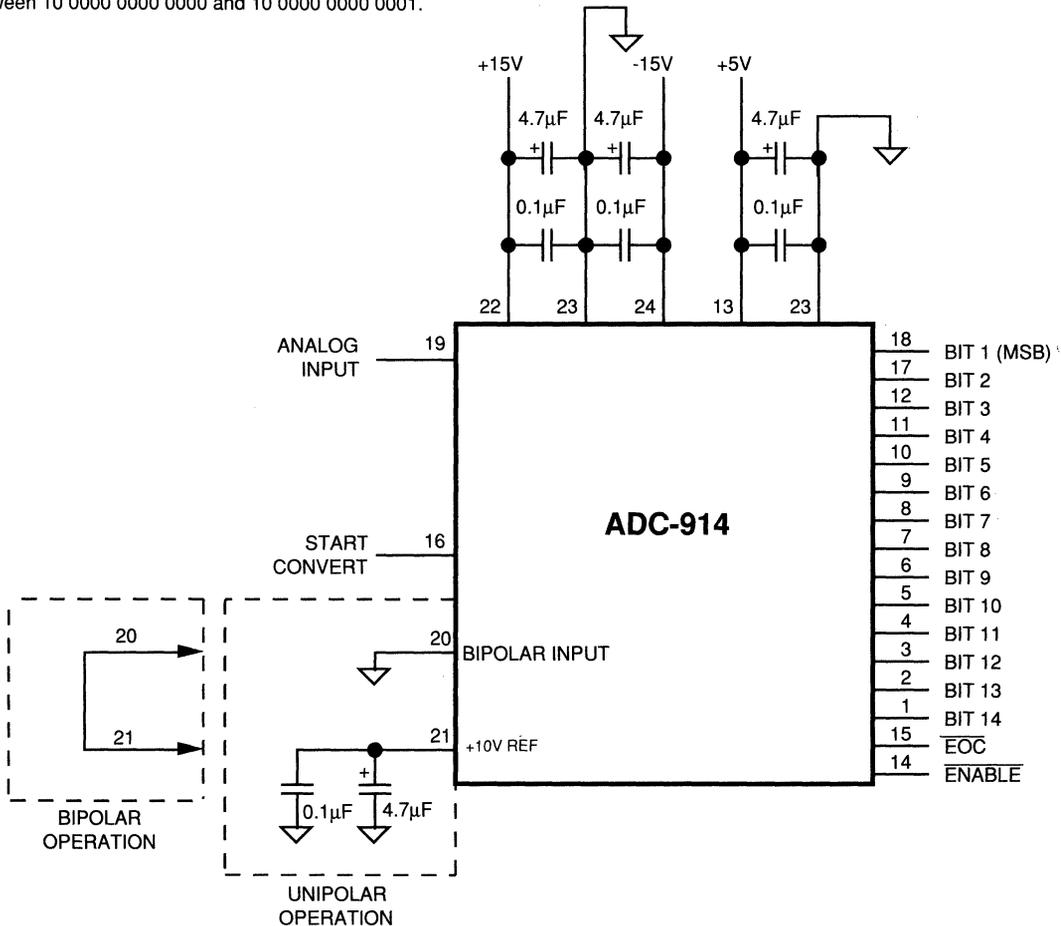

3. Full-Scale Adjustment:

Set the output of the voltage reference used in step 2 to the value shown in Table 4. Adjust the gain trimming potentiometer so that the output code flickers between 11 1111 1111 1110 and 11 1111 1111 1111.

To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in table 6.

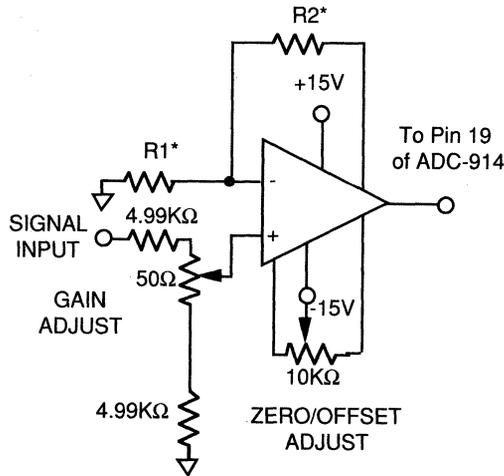

**Table 1. Input Connections**

| INPUT RANGE  | INPUT PIN | JUMPER THESE PINS: |
|--------------|-----------|--------------------|
| 0 to -10V dc | Pin 19    | Pin 20 to GROUND   |
| ±5V dc       | Pin 19    | Pin 20 to Pin 21   |

**MECHANICAL DIMENSIONS  
INCHES (MM)**

NOTE: Pins have a 0.025 inch, ±0.01 stand-off from case.

**ORDERING INFORMATION**

| MODEL     | TEMPERATURE RANGE | SEAL     |
|-----------|-------------------|----------|
| ADC-914MC | 0 °C to +70 °C    | Hermetic |
| ADC-914MM | -55 °C to +125 °C | Hermetic |

A receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883 Versions, contact DATEL.

### FEATURES

- Single supply operation
- Automatic standby mode control
- Low power consumption
- Six input ranges
- MIL temperature ranges available

### GENERAL DESCRIPTION

The ADC-HC is a complete, 12-bit, low-power, analog-to-digital converter utilizing CMOS technology. This hybrid IC incorporates active laser trimming of highly stable thin-film resistors to provide module performance with IC price, size and reliability.

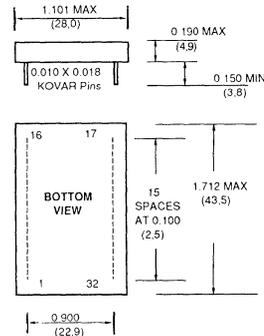

The device is ideal for portable and remote applications such as seismology, oceanography, meteorology, and pollution monitoring. Other key applications include military and aerospace, requiring wide operating temperature ranges and high reliability.

The ADC-HC converter can operate from either a single +9V dc to +15V dc power source (interrupt power mode) or from a ±9V dc to ±15V dc power source (continuous power mode) at a maximum conversion rate of 3.3 KHz.

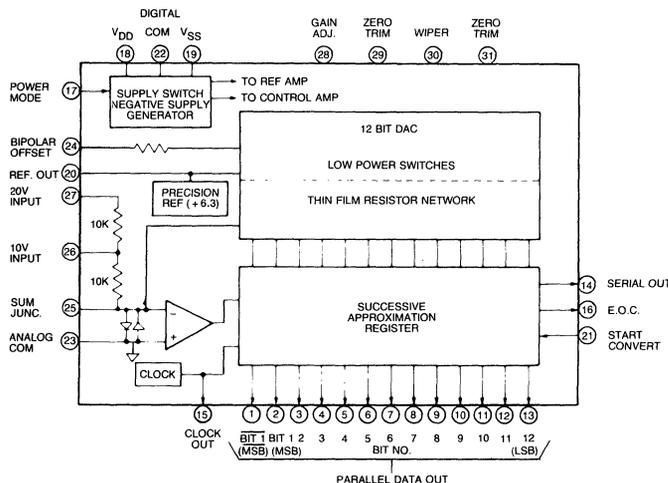

A key feature of this unit when operating in the interrupt power mode is the extremely low quiescent power consumption (less than 10 µA at 12V, 25°C).

### MECHANICAL DIMENSIONS INCHES (MM)

NOTE: PINS HAVE 0.025 INCH STANDOFF FROM CASE, ±0.01

## TECHNICAL NOTES

- The ADC-HC contains CMOS components and must be properly handled to prevent damage from static pick-up. Proper anti-static handling procedures should be observed including storage in conductive foam or shorting all pins together with aluminum foil. Do not connect in circuit under "power on" conditions. Digital signals should be applied after the converter's power has been turned on.
- For single supply (+12V nominal) or dual supply ( $\pm 12V$  nominal) operation, bypass the power input pins to ground with a 0.1  $\mu$ F ceramic capacitor. It is not critical that the supplies be balanced.
- Analog and digital grounds should be kept separate whenever possible to prevent digital signals from flowing in the analog ground circuit and inducing spurious analog signal noise. Analog Common (Pin 23) and Digital Ground (Pin 22) are not connected internally and must be tied together externally.
- The ADC-HC can operate from either a single or dual supply. When using dual supplies, tie POWER MODE (Pin 17) to  $V_{DD}$  (Pin 18). In this continuous power mode, an A/D conversion will take place when a 5 microseconds or greater positive going pulse is applied to START CONVERT (Pin 21). For single supply operation (interrupt power mode), tie Power Mode (Pin 17) to E.O.C. (Pin 16). When EOC goes low, the converter is switched to standby mode (power is disconnected to analog circuitry) and digital output data becomes valid and remains valid until next start pulse is applied. Upon receipt of a 50 microseconds minimum, 500 microseconds maximum pulse on START CONVERT (Pin 21), the converter will stabilize, make a complete conversion and return to standby mode.
- Digital output codes are listed in coding tables. Parallel data is valid when EOC is in low state. This data can be transferred into latches during a logic "1" to logic "0" transition of the EOC line. Serial data out (Pin 14) is in NRZ (non-return to zero) format. This data is guaranteed valid in a 50 nanoseconds to 300 nanoseconds time frame after the positive edge of the clock. All digital inputs and outputs are CMOS compatible. See application notes for CMOS-TTL interface.
- REF OUT (Pin 20) is a 6.3V  $\pm 5\%$  internal reference pin connection.
- For zero or offset and gain adjustment, refer to connections and calibration notes. The trim pots should be located as close as possible to the converter to avoid noise pickup. Zero point is always adjusted first, followed by gain, the adjustment with analog input at the most positive end of analog range. The range of the OFFSET (ZERO) ADJ. is  $\pm 15$  mV. The range of GAIN ADJ. is 0.1% of full scale range can also be increased by decreasing the value of the series resistor (3.9 M $\Omega$  nominal). Potentiometer values are 10K and should be 100 ppm/°C ceramic type.

CALIBRATION PROCEDURE

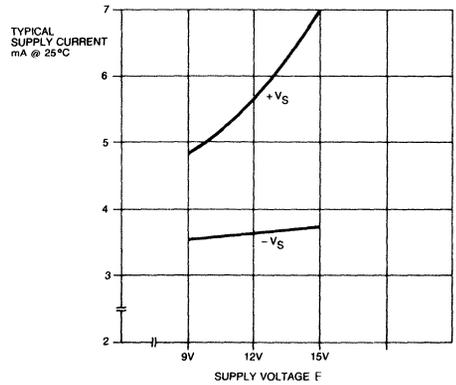

1. Connect the converter as shown in the Connection Diagram. Use the Input Pin Connections table for the desired input voltage range. Apply start conversion pulses to start pin.
2. **Zero and Offset Adjustment**  
Apply a precision voltage reference source between the selected analog input range and ground. Adjust the output of the reference source to  $\pm 1/2$  LSB. Adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 for unipolar and 1000 0000 0000 and 1000 0000 0001 for bipolar mode.
3. **Full Scale Adjustment**  
Change the output of the precision reference source for  $+FS - 1/2$  LSB. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111.
4. For bipolar operation, the offset and Full Scale Adjustment are interactive. Repeat the offset and Full Scale Adjustment procedure as necessary until both points are set.

## APPLICATIONS

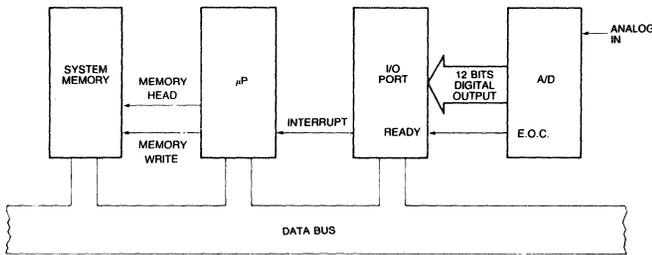

### ADC-HC INTERRUPT POWER MODE

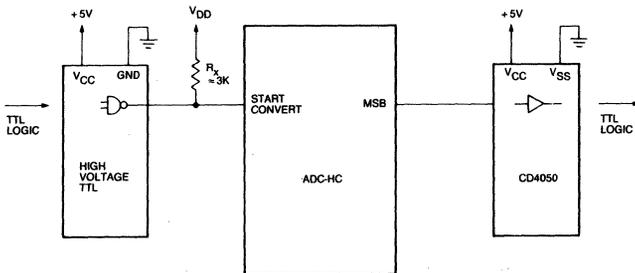

### ADC-HC CONTINUOUS POWER MODE

### LOW POWER MICRO-PROCESSOR INTERFACE

### TTL-CMOS INTERFACE

CMOS and TTL logic are not compatible due to different threshold levels. They can, however, be interfaced by simple techniques.

The START CONVERT (Pin 21) can be driven directly from an open collector, high voltage TTL gate. Resistor  $R_x$  is used to source current and bring the TTL output up to the CMOS threshold level. Typical values of  $R_x$  are 3.3K to 10K ohms.

CMOS to TTL interface requires sufficient sink current in the low state. The CD4049 (inverting) and CD4050 (noninverting) buffers, powered from +5V logic supply can accept input voltage swings of +5 to +15V from the CMOS system. Each buffer gate can drive at least one input from any TTL family.

### ORDERING INFORMATION

| MODEL          | TEMP. RANGE    | SEAL     |
|----------------|----------------|----------|
| ADC-HC12BMC    | 0 to +70 °C    | Hermetic |
| ADC-HC12BMM    | -55 to +125 °C | Hermetic |
| ADC-HC12BMM-QL | -55 to +125 °C | Hermetic |

### FEATURES

- 12-Bit resolution
- Internal sample and hold
- 6 Microseconds acquisition time
- 9 Microseconds conversion time
- Programmable input ranges
- Parallel & serial outputs

### GENERAL DESCRIPTION

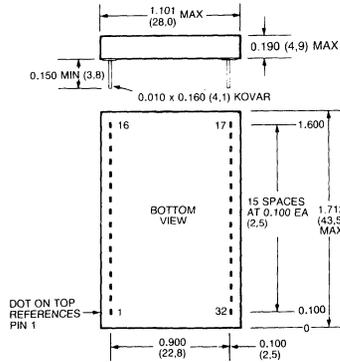

The ADC-HS12B is a high performance 12-bit hybrid A/D converter with a self-contained sample-hold. It is specifically designed for systems applications where the sample-hold is an integral part of the conversion process. The internal sample-hold has a 6 microsecond acquisition time for a full 10V dc input change; the A/D converter has a fast 9 microsecond conversion time. Five input voltage ranges are programmable by external pin connection; 0 to +5V, 0 to +10V,  $\pm 2.5V$ ,  $\pm 5V$ , and  $\pm 10V$ . Input impedance to the sample-hold is 100 megohms. Output coding is complementary binary for unipolar operation and complementary offset binary for bipolar operation, with both parallel and serial outputs brought out.

The ADC-HS12B uses a fast 12-bit monolithic DAC which includes a precision zener reference source. The circuit also contains a fast monolithic 12-bit successive approximation register, a clock and a monolithic sample-hold.

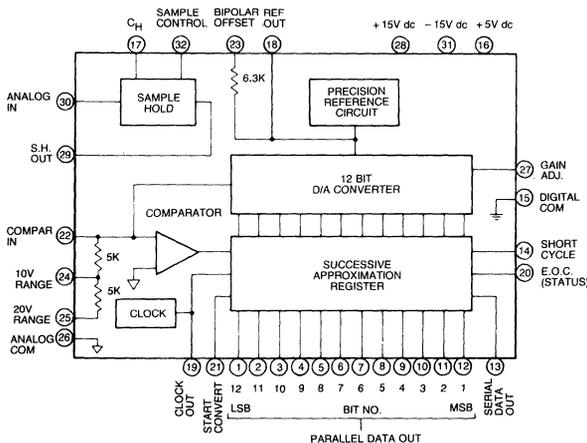

### MECHANICAL DIMENSIONS

#### INCHES (MM)

NOTE: PINS HAVE 0.025 INCH STANDOFF FROM CASE,  $\pm 0.01$ "

### FOOTNOTES:

- For sample-hold input
- All digital outputs can drive 2 TTL loads
- For 1000 pF external hold capacitor

## TECHNICAL NOTES

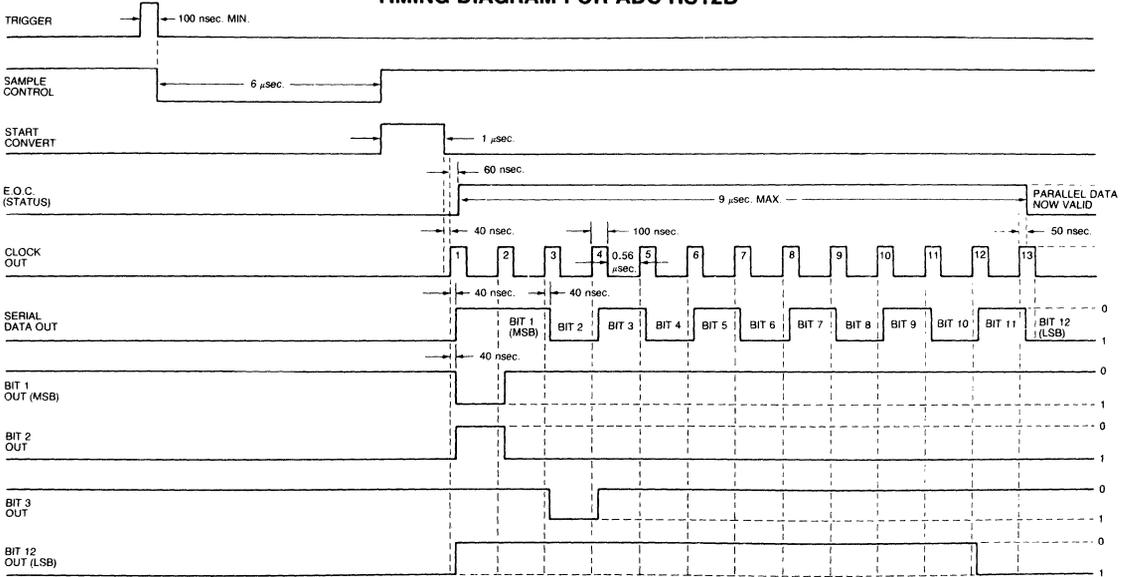

- It is recommended that the ±15V power input pins both be bypassed to ground with a 0.01 μF ceramic capacitor in parallel with a 1 μF electrolytic capacitor and the +5V power input pin be bypassed to ground with a 1 μF electrolytic capacitor as shown in the connection diagrams. In addition, pin 27 should be bypassed to ground with a 0.01 μF ceramic capacitor. These precautions will assure noise free operation of the converter.
- Digital Common (pin 15) and Analog Common (pin 26) are not connected together internally, and therefore must be connected as directly as possible externally. It is recommended that a ground plane be run underneath the case between the two commons. Analog ground and ±15V power ground should be run to pin 26 whereas digital ground and +5V dc ground should be run to pin 15.
- External adjustment of zero or offset and gain are provided for by trimming potentiometers connected as shown in the connection diagrams. The potentiometer values can be between 10K and 100K ohms and should be 100 ppm/°C, cermet types. The adjustment range is ±0.5% of FSR for zero or offset and ±0.3% for gain. The trimming pots should be located as close as possible to the converter to avoid noise pickup. Calibration of the ADC-HS12B is performed with the sample-hold connected and operating dynamically. This results in adjusting out the sample-hold errors along with the A/D converter. For slow throughput applications it is recommended that a 0.01 μF hold capacitor be used for best accuracy. With this value the acquisition time becomes 25 microseconds and the external timing must be adjusted accordingly.
- The recommended timing shown in the Timing Diagram allows 6 microseconds for the sample-hold acquisition and then 1 microsecond after the sample-hold goes into the hold mode to allow for output settling before the A/D begins its conversion cycle.
- Short cycled operation results in shorter conversion times where the conversion can be truncated to less than 12 bits. This is done by connecting pin 14 to the output bit following the last bit desired. For example, for an 8-bit conversion, pin 14 is connected to bit 9 output. Maximum conversion times are given for short-cycled conversions in the Table.
- Note that output coding is complementary coding. For unipolar operation it is complementary binary and for bipolar operation it is complementary offset binary. In cases where bipolar coding of offset binary is required, this can be achieved by inverting the analog input to the converter (using an operational amplifier connected for gain of -1.0000). The

converter is then calibrated so that -FS analog input gives an output code of 0000 0000 0000, and +FS - 1 LSB gives 1111 1111 1111.

- These converters dissipate 1.81 watts maximum of power. The case to ambient thermal resistance is approximately 25°C per watt. For ambient temperatures above 50°C, care should be taken not to restrict air circulation in the vicinity of the converter.
- These converters can be operated with an external clock. To accomplish this, a negative pulse train is applied to START

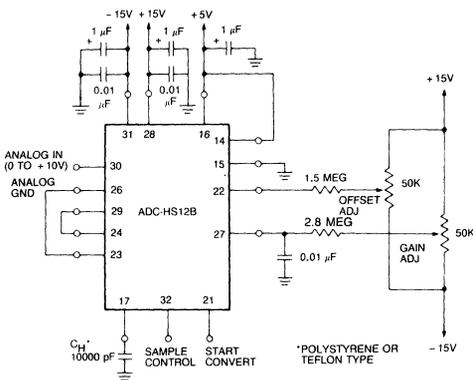

CONVERT (Pin 21). The rate of the external clock must be lower than the rate of the internal clock. The pulse width of the external clock should be between 100 nanoseconds and 300 nanoseconds. Each N bit conversion cycle requires a pulse train of N + 1 clock pulses for completion, e.g., an 8-bit conversion requires 9 clock pulses for completion. A continuous pulse train may be used for consecutive conversions, resulting in an N bit conversion every N + 1 pulses, or the E.O.C. output may be used to gate a continuous pulse train for single conversions.

**CALIBRATION PROCEDURE**

1. Connect the ADC-HS12B as shown in one of the connection diagrams. The sample-hold and A/D converter should be timed as shown in the timing diagram. The trigger pulse should be applied at a rate of 70 kHz or less and should be 100 nanoseconds minimum width.
2. **Zero and Offset Adjustments**  
Apply a precision voltage reference source between the selected analog input and ground. Adjust the output of the reference source to the value shown in the Calibration Table for the unipolar zero adjustment (zero + 1/2 LSB) or the bipolar offset adjustment (-FS + 1/2 LSB). Adjust the trimming potentiometer so that the output code flickers equally between 1111 1111 1111 and 1111 1111 1110.
3. **Full Scale Adjustment**  
Change the output of the precision voltage reference source to the value shown in the Calibration Table for the unipolar or bipolar gain adjustment (+FS - 1/2 LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 0000 0000 0001 and 0000 0000 0000.

| MODEL          | TEMP. RANGE    |
|----------------|----------------|
| ADC-HS12BMC    | 0 to +70 °C    |
| ADC-HS12BMM    | -55 to +125 °C |
| ADC-HS12BMM-QL | -55 to +125 °C |

### FEATURES

- 12-Bit resolution
- 8-or 20-Microseconds conversions
- 5 Input ranges
- Internal high Z buffer
- Short-cycle operation

### GENERAL DESCRIPTION

The ADC-HX12B and ADC-HZ12B are self-contained, high performance, 12-bit A/D converters manufactured with thick-and thin-film hybrid technology. They use the successive approximation conversion technique to achieve a 12-bit conversion in 20 and 8 microseconds respectively. Five input voltage ranges are programmable by external pin connection: 0 to +5V, 0 to +10V,  $\pm 2.5V$ ,  $\pm 5V$ , and  $\pm 10V$ . An internal buffer amplifier is also provided for applications where 100 megohm input impedance is required.

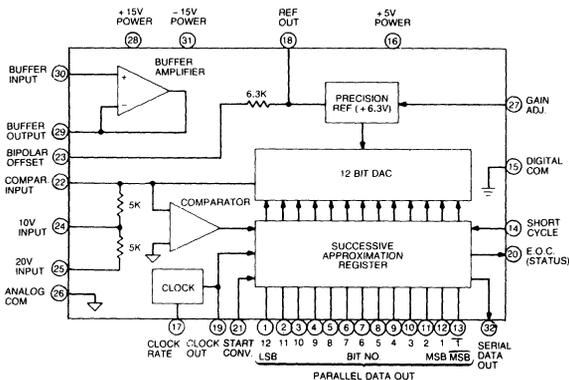

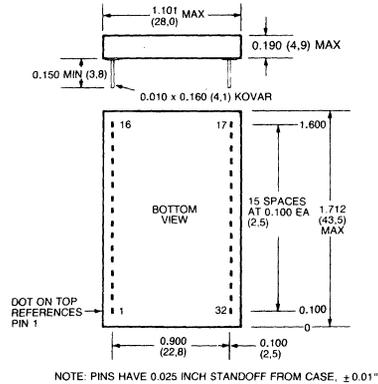

These converters utilize a fast 12-bit monolithic DAC which includes a precision zener reference source. The circuit also contains a fast monolithic comparator, a monolithic 12-bit successive approximation register, a clock and a monolithic buffer amplifier. Nonlinearity is specified at  $\pm 1/2$  LSB maximum.

Both models have identical operation except for conversion speed. They can be short-cycled to give faster conversion in lower resolution applications. Use of the internal buffer amplifier increases conversion time by 3 microseconds, the settling time of the amplifier. Output coding is complementary binary, complementary binary, or complementary two's complement. Serial data is also brought out. The package is a 32-pin ceramic case.

### FOOTNOTES:

- All digital outputs can drive 2 TTL loads.
- Without buffer amplifier used. ADC-HZ12B may require external adjustment of clock rate.
- FSR is full scale range and is 10V for 0 to +10V or ±5V input and 20V for ±10V input.
- Short cycled operation.

## TECHNICAL NOTES

- It is recommended that the ±15V power input pins both be bypassed to ground with a 0.01 μF ceramic capacitor in parallel with a 1 μF electrolytic capacitor and the +5V power input pin be bypassed to ground with a 10 μF electrolytic capacitor as shown in the connection diagrams. In addition, pin 27 should be bypassed to ground with a 0.01 μF ceramic capacitor. These precautions will assure noise free operation of the converter.
- Digital Common (pin 15) and Analog Common (pin 26) are not connected together internally, and therefore must be connected as directly as possible externally. It is recommended that a ground plane be run underneath the case between the two commons. Analog ground and ±15V power ground should be run to pin 26 whereas digital ground and +5V dc ground should be run to pin 15.
- External adjustment of zero or offset and gain are provided for by trimming potentiometers connected as shown in the connection diagrams. The potentiometer values can be between 10K and 100K ohms and should be 100 ppm/°C cermet types. The adjustment range is ±0.2% of FSR for zero or offset and ±0.3% for gain. The trimming pots should be located as close as possible to the converter to avoid noise pickup. In some cases, for example 8 bit short-cycled operation, external adjustment may not be necessary.
- Short-cycled operation results in shorter conversion times where the conversion can be truncated to less than 12 bits. This is done by connecting pin 14 to the output bit following the last bit desired. For example, for an 8-bit conversion, pin 14 is connected to bit 9 output. Maximum conversion times are given for short-cycled conversions of 8 or 10 bits. In these two cases the clock rate is also speeded up by connecting the clock rate adjust (pin 17) to +5V dc (10 bits) or +15V dc (8 bits). The clock rate should not be arbitrarily speeded up to exceed the maximum conversion rate at a given resolution, however, or missing codes will result.

- Note that output coding is complementary coding. For unipolar operation it is complementary binary and for bipolar operation it is complementary offset binary or complementary 2's complement. In cases where bipolar coding of offset binary or 2's complement is required, this can be achieved by inverting the analog input to the converter (using an op amp connected for gain of  $-1.0000$ ). The converter is then calibrated so that  $-FS$  analog input gives an output code of 0000 0000 0000, and  $+FS - 1$  LSB gives 1111 1111 1111.
- These converters dissipate 1.7 watts maximum of power. The case to ambient thermal resistance is approximately  $25^{\circ}\text{C}$  per watt. For ambient temperatures above  $50^{\circ}\text{C}$ , care should be taken not to restrict air circulation in the vicinity of the converter.
- These converters can be operated with an external clock. To accomplish this, a negative pulse train is applied to START CONVERT (Pin 21). The rate of the external clock must be lower than the rate of the internal clock as adjusted (see clock rate adjustment diagram) for the converter resolution selected. The pulse width of the external clock should be between 100 nanoseconds and 300 nanoseconds. Each N-bit conversion cycle requires a pulse train of  $N + 1$  clock pulses for completion, e.g., an 8-bit conversion requires 9 clock pulses for completion. A continuous pulse train may be used for consecutive conversions, resulting in an N-bit conversion every  $N + 1$  pulses, or the E.O.C. output may be used to gate a continuous pulse train for single conversions.
- When the input buffer amplifier is used, a delay equal to its settling time must be allowed between the input level change, such as a multiplexer channel change, and the negative-going edge of the START CONVERSION pulse. If the buffer is not required, its input (pin 30) should be tied to ANALOG GROUND (pin 26). This prevents the unused amplifier from introducing noise into the converter. For applications not using the internal buffer, the converter must be driven from a source with an extremely low input impedance.

## CALIBRATION PROCEDURE

- Connect the converter for bipolar or unipolar operation. Use the input connection table for the desired input voltage range and input impedance. Apply Start Convert pulses of 100 nanoseconds minimum duration to pin 21. The spacing of the pulses should be no less than the maximum conversion time.
- Zero and Offset Adjustments**  
Apply a precision voltage reference source between the selected analog input and ground. Adjust the output of the reference source to the value shown in the Calibration Table for the unipolar zero adjustment (zero  $+ \frac{1}{2}$  LSB) or the bipolar offset adjustment ( $-FS + \frac{1}{2}$  LSB). Adjust the trimming potentiometer so that the output code flickers equally between 1111 1111 1111 and 1111 1111 1110.
- Full Scale Adjustment**  
Change the output of the precision voltage reference source to the value shown in the Calibration Table for the unipolar or bipolar gain adjustment ( $+FS - \frac{1}{2}$  LSB). Adjust the gain trimming potentiometer so that the output code flickers equally between 0000 0000 0001 and 0000 0000 0000.

# DAC-HF Series

## Ultra-Fast D/A Converters

### FEATURES

- 8-, 10-, 12-Bit resolution
- Settling times to 25 nanoseconds
- 20 ppm/°C tempco
- Unipolar or bipolar operation
- Current output
- Internal feedback resistor

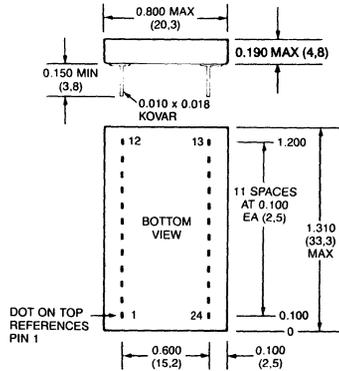

### GENERAL DESCRIPTION

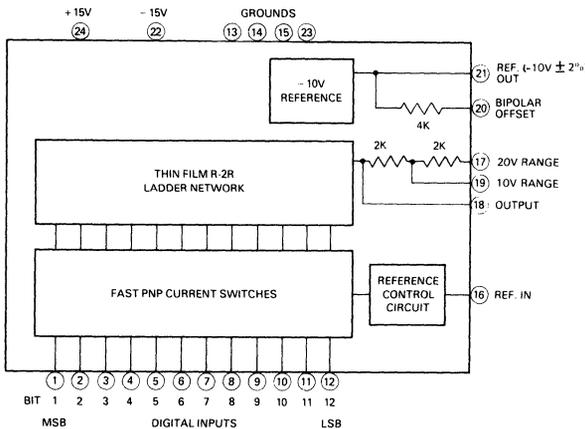

The DAC-HF Series of hybrid DAC's are ultra high-speed, current output devices. They incorporate state-of-the-art performance in a miniature package, achieving maximum output settling times of 25 nanoseconds for the 8- and 10-bit models and 50 nanoseconds for the 12-bit model. They can be used to drive a resistor load directly for up to  $\pm 1V$  output or a fast operational amplifier (such as DATEL's AM-500) for higher voltage outputs with sub-microsecond settling times. A tapped feedback resistor and a bipolar offset resistor are included internally to give five programmable output voltage ranges with an external operational amplifier.

The DAC-HF design combines proven hybrid production techniques with advanced circuit design to realize high speed current switching. The design incorporates fast PNP current switches driving a low impedance R-2R thin-film ladder network. The nichrome thin-film resistor network is deposited by electron beam evaporation on a low capacitance substrate to assure high-speed performance. The resistors are then functionally trimmed by laser for optimum linearity.

### MECHANICAL DIMENSIONS INCHES (MM)

NOTE: PINS HAVE 0.025 INCH STANDOFF FROM CASE,  $\pm 0.01$ "

NOTE: FOR DAC-HF10B PINS 11 & 12 ARE NO CONNECTION  
FOR DAC-HF8B PINS 9, 10, 11 & 12 ARE NO CONNECTION

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION        | PIN | FUNCTION       |
|-----|-----------------|-----|----------------|
| 1   | BIT 1 IN (MSB)  | 13  | GROUND         |
| 2   | BIT 2 IN        | 14  | GROUND         |
| 3   | BIT 3 IN        | 15  | GROUND         |
| 4   | BIT 4 IN        | 16  | REF. IN        |
| 5   | BIT 5 IN        | 17  | 20 V RANGE     |

| Operating Temperature Range   | 0°C to +70°C (BMC)                            |      |      |
| Storage Temperature Range   | -55°C to +125°C (BMM, 883B)                   |      |      |
| Package Type  | 24-Pin Ceramic DIP                            |      |      |
| Pins  | 0.010 × 0.018 inch Kovar                      |      |      |
| Weight  | 0.2 oz (6g.)                                  |      |      |
| <b>FOOTNOTES:</b>   |   |      |      |
| 1. Full scale current change to 1 LSB with 400Ω load.                                       |   |      |      |
| 2. With External Operational Amplifier.   |   |      |      |
| 3. F.S.R. is Full Scale Range, or the difference between minimum and maximum output values. |   |      |      |

### TECHNICAL NOTES

- Proper operation of the DAC-HF series converters is dependent on good board layout and connection practices. Bypass supplies as shown in the connection diagrams. Mount bypass capacitors close to the converter, directly to the supply pins where possible.
- Use of a ground plane is particularly important in high speed D to A converters as it reduces high frequency noise and aids in decoupling the digital inputs from the analog output. Avoid ground loop problems by connecting all grounds on the board to the ground plane. The remainder of the ground plane should include as much of the circuit board as possible.
- When the converter is configured for voltage output with an external operational amplifier, keep the leads from the converter to the output amplifier as short as possible.
- The high speed current switching technique used in the DAC-HF series inherently reduces the amplitude and duration of large transient spikes at the output ("glitches"). The most severe glitches occur at half-scale, the major carry transition from 011 ... 1 to 100 ... 0 or vice versa. At this time, a skewing of the input codes can create a transition state code of 111 ... 1. The duration of the "transition state code" is dependent on the degree of skewing but its effect is dependent on the speed of the DAC (an ultra-fast DAC will respond to these brief spurious inputs to a greater degree than a slow DAC). Minimize the effects of input skewing by using a high-speed input register to match input switching times. The input register recommended for use with the DAC-HF is easily implemented with two Texas Instruments SN74S174 hex D-type flip-flops. This register will reduce glitches to a very low level and ensure fast output settling times.
- Test the DAC-HF using a low capacitance test probe (such as a 10X probe). Take care to assure the shortest possible connection between probe ground and circuit ground. Long probe ground leads may pick up environmental E.M.I. causing artifacts on the scope display, i.e., signals that do not originate at the unit under test.
- Passive components used with the DAC-HF may be as indicated here: 0.1 μF and 1 μF bypass capacitors should be ceramic type and tantalum type respectively; the 400Ω output load is a 0.1% 10 ppm/°C metal film type; adjustment potentiometers are cermet types; other resistors may be ±10% carbon composition types.
- Output voltage compliance is ±1.2V to preserve the linearity of the converter. In the bipolar mode, the DAC-HF can be operated with no load to give an output voltage of ±1.0V. In the unipolar mode, the load resistance must be less than 600Ω to give less than +1.2V output. The specified output currents of 0 to +5 mA and ±2.5 mA are measured into a short circuit or an operational amplifier summing junction.

## CONNECTION AND CALIBRATION

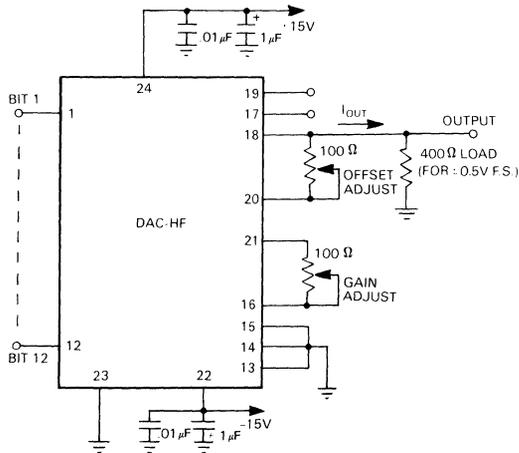

### UNIPOLAR CURRENT OUTPUT CONNECTIONS

### UNIPOLAR CURRENT OUTPUT CALIBRATION PROCEDURE

1. Connect the converter as shown in the connection diagram.
2. Set all inputs low and adjust the ZERO ADJUST potentiometer for a reading of 0V at the output.
3. Set all inputs high and adjust the GAIN ADJUST potentiometer for a reading of  $-F.S. + 1 \text{ LSB}$  (given in the coding table for 12-bit units).

### BIPOLAR CURRENT OUTPUT CONNECTIONS

### BIPOLAR CURRENT OUTPUT CALIBRATION PROCEDURE

1. Connect the converter as shown in the connection diagram.
2. Set all inputs low and adjust the OFFSET ADJUST potentiometer for an output reading of  $+F.S.$ , (given in the coding table for 12-bit units).
3. Set all inputs high and adjust the GAIN ADJUST potentiometer for an output reading of  $-F.S. + 1 \text{ LSB}$ , (given in the coding table for 12-bit units).

# DAC-HK Series

## 12-Bit Hybrid DAC's with Input Register

### FEATURES

- 12-Bit resolution
- 20 ppm/°C Tempco
- Input register
- 2 Coding options
- Fast settling time

### GENERAL DESCRIPTION

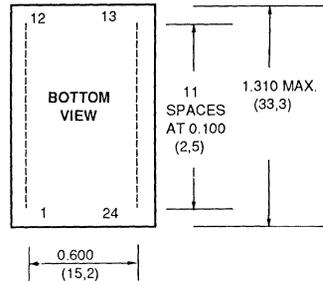

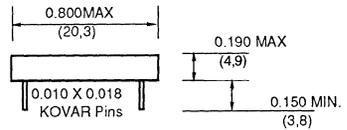

The DAC-HK Series hybrid D/A converters are high performance 12-bit devices with a fast settling voltage output. They incorporate a level controlled input storage register and are specifically designed for systems applications such as data bus interfacing with computers. When the "load" input is high, data in the storage register is held and when the load input is low, data is transferred through to the DAC. There are two basic models available by coding option: binary, and two's complement. The output voltage ranges are externally pin-programmable and include: 0 to +2.5V, 0 to +5V, 0 to +10V,  $\pm 2.5V$ ,  $\pm 5V$ , and  $\pm 10V$ .

The DAC-HK Series contains a precision zener reference circuit. This eliminates code-dependent ground currents by routing current from the positive supply to the internal ground node a determined by the R-2R ladder network. The internal feedback resistors for the on-board amplifier track the ladder network resistors, enhancing temperature performance. The excellent tracking of the resistors results in a differential nonlinearity tempco of 2 ppm/°C maximum. The temperature coefficient of gain is 20 ppm/°C maximum and tempco of zero is  $\pm 3$  ppm/°C maximum.

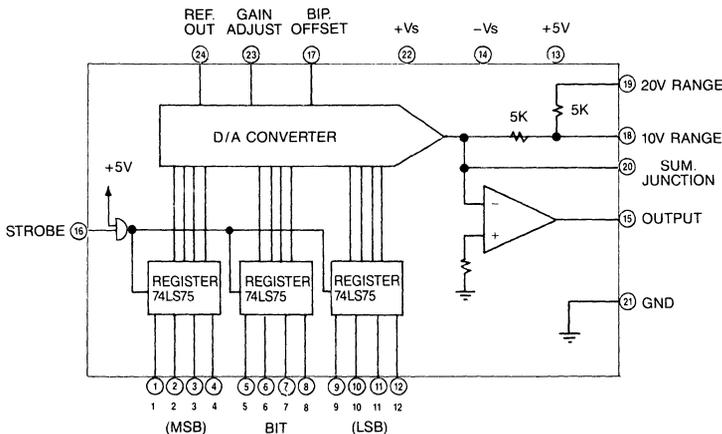

### MECHANICAL DIMENSIONS

INCHES (mm)

NOTE: Pins have a 0.025 inch,  $\pm 0.01$  stand-off from case.

### INPUT/OUTPUT CONNECTIONS

| PIN | FUNCTION        | PIN | FUNCTION     |

## FOOTNOTES:

1. For two's complement coding order the model described under ordering information.
2. Logic levels are the same as for data inputs.
3. By external pin connection.
4. For ± 12V dc, + 5V dc operation, contact factory.

## TECHNICAL NOTES

1. It is recommended that these converters be operated with local supply bypass capacitors of 1 μF (tantalum type) at the + 15, - 15, and + 5V supply pins. The capacitors should be connected as close to the pins as possible. In high RFI noise environments these capacitors should be shunted with 0.01 μF ceramic capacitors.
2. The analog, digital, and power grounds should be separated from each other as close as possible to pin 21 where they all must come together.
3. The "load" control pin is a level triggered input which causes the register to hold data with a high input and transfer data to the DAC with a low input.
4. A setup time of 50 nanoseconds minimum must be allowed for the input data. The DAC output voltage begins to change when the register output changes.
5. The external gain adjustment shown in the Connection Diagrams has a range of ± 0.2% of full scale. If a wider range is desired the 18-Megohm resistor can be decreased slightly in value. The full-scale output is typically accurate within ± 0.1% with no adjustment. The zero, or offset, adjustment has a range of ± 0.35% of FS.
6. If the reference output terminal (pin 24) is used, an operational amplifier in non-inverting mode should be used as a buffer. Current drawn from pin 24 should be limited to ± 10 μA in order not to affect the T.C. of the reference.

## APPLICATIONS

### INTERFACING TO ≥ 12 BIT DATA BUS

### INTERFACING TO 8 BIT DATA BUS

## CALIBRATION PROCEDURE

Select the desired output voltage range and connect the converter up as shown in the Output Range Selection Table and the Connection Diagrams. Refer to the Coding Tables.

### UNIPOLAR OPERATION

- Zero Adjustment.** Set the input digital code to 0000 0000 0000 and adjust the ZERO ADJ. potentiometer to give 0.0000V output.
- Gain Adjustment.** Set the input digital code to 1111 1111 1111 (straight binary) and adjust the GAIN ADJ. potentiometer to give the full-scale output voltage shown in the Coding Table.

### BIPOLAR OPERATION

- Offset Adjustment.** Set the digital input code to 0000 0000 0000 (offset binary) or 1000 0000 0000 (two's complement) and adjust the OFFSET ADJ. potentiometer to give the negative full-scale output voltage shown in the Coding Table.
- Gain Adjustment.** Set the digital input code to 1111 1111 1111 (offset binary) or a 0111 1111 1111 (two's complement) and adjust the GAIN ADJ. potentiometer to give the positive full-scale output voltage shown in the Coding Table.

The MIL-STD-883B units are available under DESC Drawing Number 5962-89528.

### FEATURES

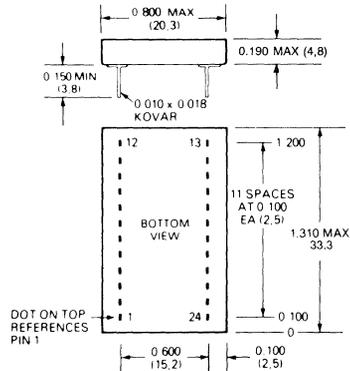

- 16-Bit binary model
- Voltage outputs
- 15 ppm/°C Maximum gain tempco
- Linearity to  $\pm 0.003\%$

### GENERAL DESCRIPTION

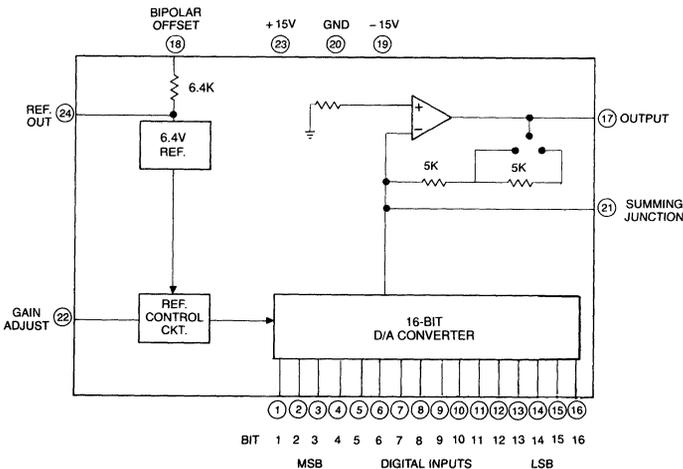

The DAC-HP series are high resolution hybrid D/A converters with voltage output. They are self-contained, including a low tempco zener reference circuit and output operational amplifier, all in a miniature 24-pin double spaced ceramic DIP package. The DAC-HP16B has 16-bit binary resolution with  $\pm 0.003\%$  linearity. Input coding is complementary binary and complementary offset binary for the DAC-HP16B. This device operates in both unipolar and bipolar modes with output voltages of 0 to +10V dc and  $\pm 5V$  dc respectively. Binary versions with a bipolar output voltage range of  $\pm 10V$  dc are available, denoted by the suffix "-1" after the model designation.

## TECHNICAL NOTES

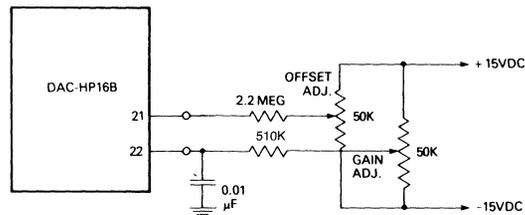

1. It is recommended that these converters be operated with local supply bypass capacitors of 1 μF (tantalum type) at the +15V and -15V supply pins. The capacitors should be connected as close to the pins as possible. In high frequency noise environments an additional 0.01 μF ceramic capacitor should be used in parallel with each tantalum bypass.
2. When laying out the circuit board for this device, isolate the analog, digital, and power grounds as much as possible from each other before joining them at pin 20.
3. The external gain adjustment shown in the diagrams gives an adjustment of ±0.2% of full-scale range. The converters are internally trimmed to ±0.1% at full scale. A wider range of adjustment may be achieved by decreasing the value of the the 510 Kohm resistor.
4. The zero adjustment, or offset adjustment, has an adjustment range of ±0.35% of full-scale range. The unipolar zero is internally set to zero within ±0.1% of full-scale range.
5. If the reference output (pin 24) is used, it must be buffered by an operational amplifier in the noninverting mode. Current drawn from pin 24 should be limited to ±10 μA in order that the temperature coefficient of the reference circuit not be affected. This is sufficient current for the bias current of most of the popular operational amplifier types.

## CALIBRATION PROCEDURE

For bipolar operation connect Bipolar Offset (pin 18) to Summing Junction (pin 21). For unipolar operation connect Bipolar Offset (pin 18) to Ground (pin 20). In making the following adjustments, refer to the coding tables.

1. **Zero Adjustment.** Set the input digital code to 1111 1111 1111 1111 and adjust the ZERO ADJ. potentiometer to give 0.00000V output unipolar or -FS bipolar operation.
2. **Gain Adjustment.** Set the input digital code to 0000 0000 0000 0000 (complementary binary) and adjust the GAIN ADJ. potentiometer to give +9.99985V output unipolar or +FS - 1 LSB output bipolar operation.

### FEATURES

- 12-Bit binary
- 5 Output ranges
- 3 Microseconds settling time
- Internal reference and output amplifier
- High performance

### GENERAL DESCRIPTION

The DAC-HZ Series are high performance, hybrid 12-bit binary digital-to-analog converters. These converters are manufactured using thin- and thick-film technology. They are complete and self-contained with a precision internal reference and fast output operational amplifier. Pin-programmable output voltage ranges are provided for a high degree of application flexibility; the output voltage ranges are 0 to  $\pm 5V$  dc, 0 to  $+10V$  dc,  $\pm 2.5V$  dc,  $-5V$  dc, and  $\pm 10V$  dc. Current output is also provided.

The DAC-HZ Series contains a precision zener reference circuit. This eliminates code-dependent ground currents by routing current from the positive supply to the internal ground node as determined by the R-2R ladder network. The internal feedback resistors for the on-board amplifier track the ladder network resistors, enhancing temperature performance. The excellent tracking of the resistors results in a differential nonlinearity tempco of 2 ppm/ $^{\circ}C$  maximum. The temperature coefficient of gain is 20 ppm/ $^{\circ}C$  maximum and tempco of zero is  $\pm 3$  ppm/ $^{\circ}C$  maximum.

### INPUT/OUTPUT CONNECTIONS

| 1. FSR is full scale range and is 10V for 0 to +10V or -5V to +5V output; 20V for $\pm$ 10V output, etc. |   |                                     |
| 2. Current output mode.  |   |                                     |
| 3. For 2.5k or 5k feedback. For 10k feedback the settling time is 4 microseconds.                        |   |                                     |
| 4. For $\pm$ 12V dc operation, contact factory.  |   |                                     |

## TECHNICAL NOTES

1. The DAC-HZ12 series converters are designed and factory calibrated to give  $\pm$ 1/2 LSB linearity (binary version) with respect to a straight line between end points. This means that if zero and full scale are exactly adjusted externally, the relative accuracy will be  $\pm$ 1/2 LSB everywhere over the full output range without any additional adjustments.
2. These converters must be operated with local supply by-pass capacitors from +15V to ground and -15V to ground. Tantalum type capacitors of 1  $\mu$ F are recommended and should be mounted as close as possible to the converter. If the converters are used in a high frequency noise environment a 0.01  $\mu$ F ceramic capacitor should be used across each tantalum capacitor.
3. When operating in the current output mode the equivalent internal current source of 2 mA must drive both the internal source resistances and the external load resistor. A 300 nanosecond output settling time is achieved for the voltage across a 100 ohm load resistor; for higher value resistors the settling time becomes longer due to the output capacitance of the converter. For fastest possible voltage output for a large transition, an external fast settling amplifier such as DATEL's AM-500 should be used in the inverting mode. Settling time of less than 1 microsecond can be achieved. See application diagram.

## CALIBRATION PROCEDURE

1. Select the desired output range and connect the converter up as shown in the Output Range Selection table and the Standard Connection diagrams.
2. To calibrate, refer to the Coding Tables. Note that complementary coding is used.
3. **Zero and Offset Adjustments**  
For unipolar operation set all digital inputs to "1" (+2.0 to +5.5V) and adjust the ZERO ADJ. potentiometer for zero output voltage or current. For bipolar operation set all digital inputs to "1" and adjust the OFFSET ADJ. potentiometer for the negative full scale (for voltage out) or positive full scale (for current out) output value shown in the Coding Table.
4. **Gain Adjustment**  
Set all digital inputs to "0" (0V to +0.8V) and adjust the GAIN ADJ. potentiometer for the positive full scale (for voltage out) or negative full scale (for current out) output value shown in the Coding Table.

## OUTPUT RANGE SELECTION

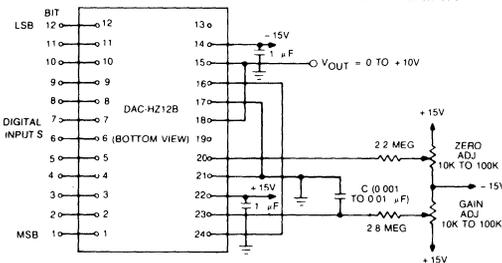

| BIN. RANGE | CONNECT THESE PINS TOGETHER |         |         |         |
|------------|-----------------------------|---------|---------|---------|
| $\pm$ 10V  | 15 & 19                     | 17 & 20 | —       | 16 & 24 |
| $\pm$ 5V   | 15 & 18                     | 17 & 20 | —       | 16 & 24 |
| $\pm$ 2.5V | 15 & 18                     | 17 & 20 | 19 & 20 | 16 & 24 |
| +10V       | 15 & 18                     | 17 & 21 | —       | 16 & 24 |
| +5V        | 15 & 18                     | 17 & 21 | 19 & 20 | 16 & 24 |
| $\pm$ 1 mA | —                           | 17 & 20 | —       | 16 & 24 |
| -2 mA      | —                           | 17 & 21 | —       | 16 & 24 |

VOLTAGE OUTPUT IS AT PIN 15.  
CURRENT OUTPUT IS AT PIN 20.

**EQUIVALENT CURRENT MODE OUTPUT CIRCUIT**

## USE OF HIGH SPEED EXTERNAL OP AMP FOR FASTER SETTLING

## PRECISION, LOW COST BASE LINE RAMP GENERATOR

THIS CIRCUIT DEVELOPS A HIGHLY LINEAR (.01%) OUTPUT VOLTAGE RAMP FROM 0 TO +10V. THE RAMP CAN BE MADE AS SLOW AS DESIRED WITHOUT AFFECTING LINEARITY BY SETTING THE PULSE RATE OF THE TIMING CIRCUIT TO THE PROPER VALUE. THE OUTPUT RAMP IS GENERATED IN DISCRETE STEPS OF .024% FS (4096 STEPS FOR FS CHANGE).

## FEATURES

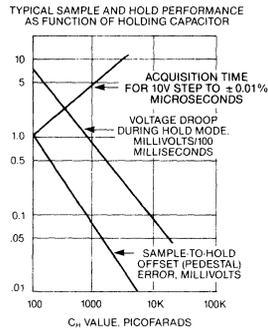

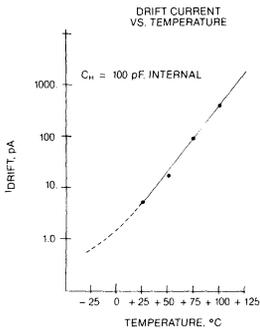

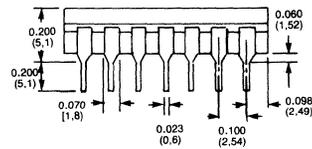

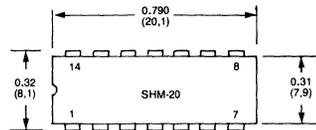

- Internal hold capacitor
- 1 Microsecond acquisition time
- 1 Nanosecond aperture uncertainty
- 0.01% Accuracy
- 0.08 MicroV/microsecond droop rate
- Differential inputs

## GENERAL DESCRIPTION

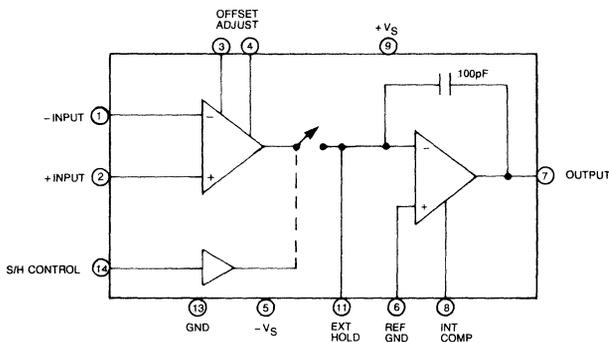

DATEL's SHM-20 is a low-cost, complete monolithic sample-hold amplifier which includes an internal 100 pF MOS hold capacitor. Primarily designed for high-speed analog signal processing applications, the SHM-20 features a typical acquisition time of 1.0 microsecond for a 10V input step to 0.01%. Aperture uncertainty is typically 1 nanosecond and droop rate is as low as 0.08  $\mu\text{V}/\text{microsecond}$ .

### POWER REQUIREMENTS<sup>8</sup>

|                        |                       |
|------------------------|-----------------------|
| Positive Supply, Pin 9 | +15V, ±0.5V at 11 mA  |
| Negative Supply, Pin 5 | -15V, ±0.5V at -11 mA |

### PHYSICAL/ENVIRONMENTAL

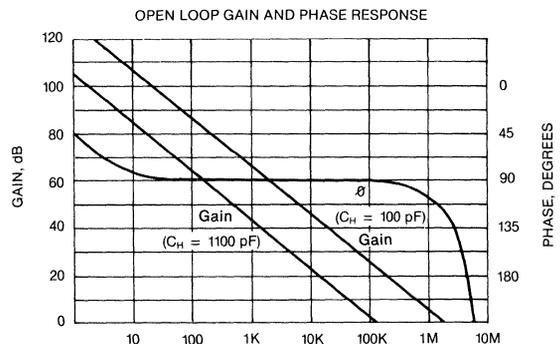

|                       |                     |
|-----------------------|---------------------|
| Operating Temp. Range | 0 to +70 °C         |
| Storage Temp. Range   | -65 to +150 °C      |
| Package Type          | 14-pin, Ceramic DIP |

## Footnotes

- Internal power dissipation may limit output current below +20 mA.
- Over full operating temperature range.
- Cannot tolerate even a momentary short circuit to ground or either supply.
- Voltage gain = +1
- Voltage gain = +1, load resistance = 1 kΩ, load capacitance = 50 pF, output voltage = 100 mV P-P.
- Input voltage = 0V, digital input voltage = 3.5V.
- Output voltage = 10V step.
- A power supply voltage as low as ±12V may be used. However, this will cause some degradation in performance.
- For C<sub>H</sub> = 100 pF. For C<sub>H</sub> = 1000 pF Pedestal Error is 0.1 mV. For C<sub>H</sub> = 0.01 μF Pedestal Error is 0.01 mV.

## TECHNICAL NOTES

- A printed circuit board with ground plane is recommended for best performance. The supply pins (pins 5, 9) should be bypassed to ground with a 0.01 to 0.1 μF ceramic capacitor as close to the pins as possible.
- If an external hold capacitor (C<sub>H</sub>) is connected to pins 7 and 11, then a noise bandwidth capacitor with a value of 10% of the value of the external hold capacitor should be connected from pin 8 to signal ground, pin 6. Exact value and type are not critical.
- The Hold Capacitor (C<sub>H</sub>) should have high insulation resistance and low dielectric absorption to minimize droop error. For operating temperatures up to +70 °C, polystyrene dielectric is a good choice. Any PC connections to the hold capacitor terminal (pin 11) should be kept short and "guarded" by the ground plane to avoid errors due to drift currents from nearby signal lines or power supply voltages.
- The offset adjust may be used to eliminate the pedestal error by connecting a 10 K ohm pot between pins 3 and 4 and connecting the wiper to the -15V supply, pin 5.

## ORDERING INFORMATION

| MODEL NO. | OPERATING TEMP. RANGE |
|-----------|-----------------------|
| SHM-20C   | 0 to +70 °C           |

### FEATURES

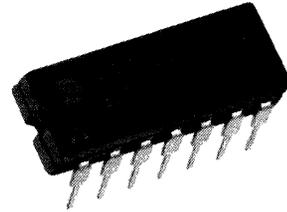

- 500 nS Acquisition time to 0.01%
- Droop rate of 0.01  $\mu\text{V}/\mu\text{S}$
- Internal hold capacitor
- 90/V  $\mu\text{S}$  Slew rate
- Low 0.5 mV offset voltage

### GENERAL DESCRIPTION

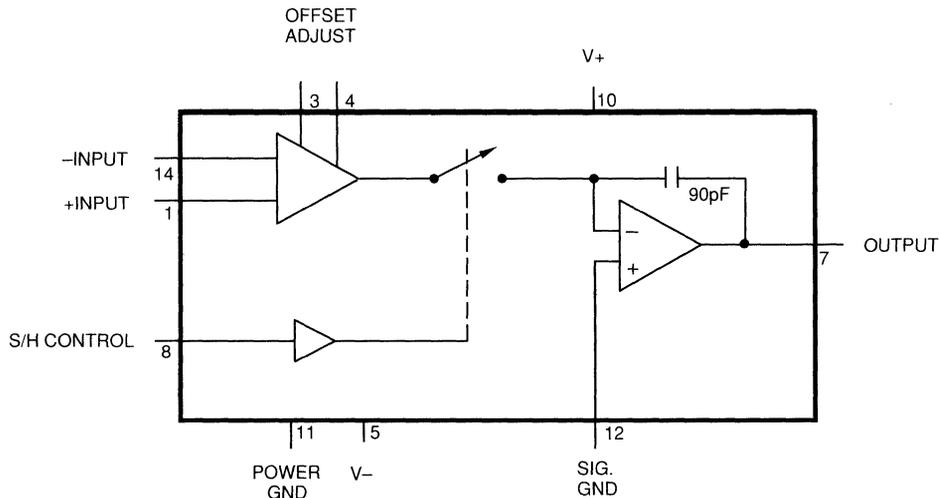

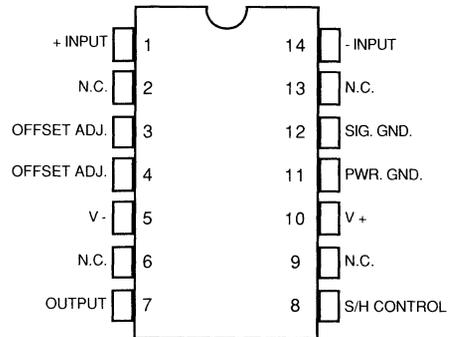

DATEL's SHM-30C is a complete monolithic sample-hold amplifier which includes an internal 90 pF MOS hold capacitor. Primarily designed to be used in precision, high speed data acquisition applications, the SHM-30C features an acquisition time of 500 nS typical to 0.01%, and a droop rate of 0.01  $\mu\text{V}/\mu\text{S}$ . Other salient features of the SHM-30C include an aperture uncertainty time of 0.1 nS, a slew rate of 90 V/ $\mu\text{S}$ , and a fully differential input.

The SHM-30C is composed of an input amplifier designed to deliver large amounts of current, a low leakage switch, and an integrator. The low pedestal error of 0.5 mV can be trimmed to zero with a single potentiometer for demanding applications.

The SHM-30C is packaged in a 14-pin ceramic DIP and operates over the temperature of 0°C to +70°C.

Pinout for SHM-30

| Operating Temperature Range | 0°C to +70 °C     |
| Storage Temperature Range   | -55 °C to +150 °C |
| Package Type                | 14-pin, Cerdip    |

**FUNCTIONAL SPECIFICATIONS**

Typical at 25 °C range unless otherwise noted.

**ANALOG INPUT**

|                                  |           |
|----------------------------------|-----------|
| Input Voltage Range, min         | ±10V      |
| Input Impedance, min             | 5MΩ       |
| Input Capacitance                | 3 pF      |
| Input Offset Voltage, max.       | 1.5 mV    |
| Input Offset Voltage Drift, max. | 10 μV/ °C |
| Input Bias Current, max.         | ±300 nA   |
| Input Offset Current, max.       | 300 nA    |

**DIGITAL INPUTS**

|   |       |
|---|-------|
| Logic Level High, V <sub>IN</sub> ("1"), min. | 2.0V  |
| Logic Level Low, V <sub>IN</sub> ("0"), max.  | 0.8V  |
| High Level Input Current, max.                | 40 μA |
| Low Level Input Current, max.                 | 40 μA |

**OUTPUT**

|                             |         |
|-----------------------------|---------|
| Output Voltage Range, min.  | ±10V    |
| Output Current, min.        | ±10 mA  |
| Output Impedance, Hold Mode | 0.2 ohm |

**PERFORMANCE**

|   |                         |
|---|-------------------------|
| DC Gain   | 2 x 10 <sup>6</sup> V/V |
| Gain Bandwidth Product <sup>5</sup>             | 4.5 MHz                 |
| Hold Mode Feedthrough, 20V pk-pk, 100 KHz       | -88 dB                  |
| Droop Rate                                      | 0.01 μV/μS              |
| Over Full Temp Range, max.                      | 10 μV/μS                |
| Pedestal Error <sup>4</sup>                     | 0.5 mV                  |
| Total Output Noise, DC to 4 MHz, Sample Mode    | 230 μVRMS               |
| Hold Mode                                       | 190 μVRMS               |
| Power Supply Rejection Ratio, min. <sup>6</sup> | 86 dB                   |
| Common Mode Rejection Ratio <sup>2</sup> , min. | 86 dB                   |

**DYNAMIC CHARACTERISTICS**

|  |        |
|--|--------|
| Acquisition Time                         | 350 nS |
| 10V to 0.1% over full temp. range, max.  | 500 nS |
| 10V to 0.01% over full temp. range, max. | 900 nS |
| Aperture Delay Time                      | -25 nS |
| Aperture Uncertainty Time                | 0.1 nS |
| Aperture Time                            | 20 nS  |
| Hold Mode Settling Time, 0.01%, max      | 200 nS |
| Rise Time <sup>3</sup>                   | 70 nS  |
| Overshoot <sup>3</sup>                   | 10%    |
| Slew Rate <sup>5</sup>                   | 90V/μS |

Notes:

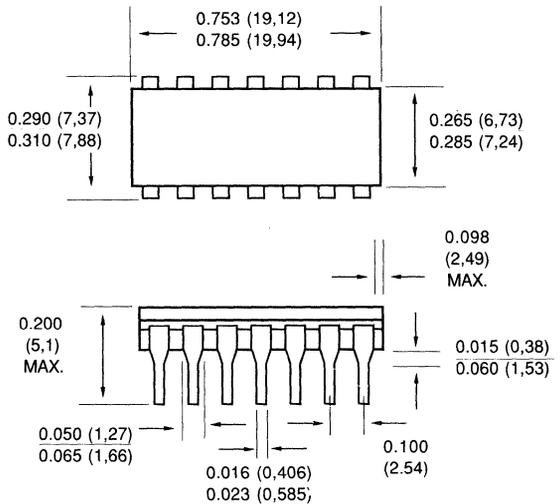

1. Internal power dissipation may limit output power below +17 mA
2. V<sub>CM</sub> = ±10V dc
3. V<sub>O</sub> = 200 mV pk-pk, R<sub>L</sub> = 2K , C<sub>L</sub> = 50 pF
4. V<sub>IN</sub> = 0V; S/H control signal 3.5V with 20 nS rise time from 0V to 3.5V
5. V<sub>O</sub> = 20V Step, R<sub>L</sub> = 2K , C<sub>L</sub> = 50 pF
6. Based on a three volt delta in each supply, i.e. 15V = ±1.5V dc

**TECHNICAL NOTES**

1. A printed circuit board with ground plane is recommended for optimum performance. Bypass capacitors (0.01 to 0.1 μF ceramic) should be provided from each power supply terminal to the PWR GND terminal on Pin 11.
2. The internal hold capacitor is 90 pF MOS.
3. The output circuit is not short-circuit protected. Only momentary short-circuits to ground are permissible.

**MECHANICAL DIMENSIONS**

INCHES (mm) MIN.  
INCHES(mm) MAX.

**ORDERING INFORMATION**

SHM-30C 0 to +70 °C

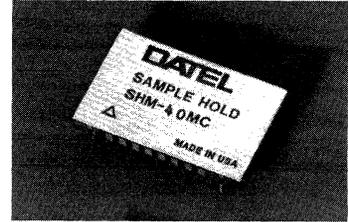

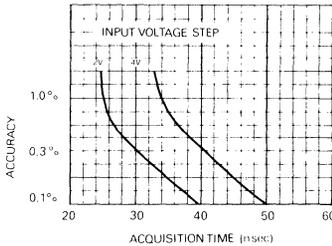

### FEATURES

- 40 nSec Acquisition time
- Dual outputs
- 10 pSec Aperture uncertainty
- 40 MHz bandwidth
- 30 mA Output current

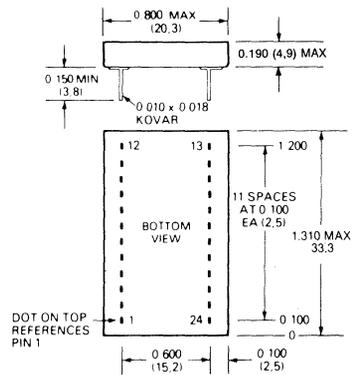

### GENERAL DESCRIPTION

DATEL's SHM-40 is an ultra-fast sample and hold designed for high speed analog signal processing applications. The SHM-40 acquires a 2V input change to 0.1% in only 40 nSec and aperture uncertainty time is less than 10 pSec. sample-mode bandwidth is 40 MHz.

The SHM-40 is a complete sample-and-hold, containing an input buffer amplifier, a precision 53 pF MOS holding capacitor, and two output buffer amplifiers. The sampling switch is controlled by a series 10,000 complementary ECL input. An ECL differential line driver can be conveniently used for the sample control inputs.

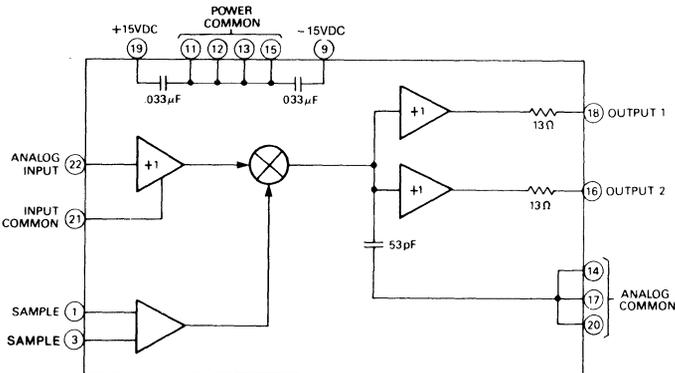

MECHANICAL DIMENSIONS  
INCHES (MM)

NOTE: PINS HAVE 0.025 INCH STANDOFF FROM CASE. ±0.01"

| <b>FOOTNOTES:</b>   |  |         |       |       |
| 1. Should be purely resistive. See technical note 3.  |  |         |       |       |
| 2. Input logic voltage levels are V <sub>in</sub> "0" = -1.5V to -1.4V, and V <sub>in</sub> "1" = -0.7V to -1.05V. These are differential ECL 10,000. |  |         |       |       |
| 3. Specified for each output, both outputs may be tied together for decreased output impedance and increased output current.                          |  |         |       |       |

## TECHNICAL NOTES

- The use of good high frequency circuit board layout techniques is required for rated performance. The power common, analog common, and input common pins are not connected internally and therefore must be connected externally as directly as possible through a low inductance, low resistance path. The extensive use of a ground plane for all common connections is highly recommended.
- Although they are internally bypassed with 0.033 μF capacitors the supply pins should be externally bypassed with 0.1 μF ceramic chip capacitors mounted as close to the supply pins as possible.
- The SHM-40 inputs and outputs are sensitive to unusual loading or long lines. The analog input must be nonreactive so that leads should be short and purely resistive. Also, the complementary ECL driver should be as close as possible to pins 1 and 3 to minimize lead lengths to these pins.
- The maximum, differential, digital input voltage is ±5V. For example, if pin 3 is at a potential of -5V, pin 1 may not exceed 0V.
- The SHM-40 has no significant acquisition time drift with temperature.
- A positive pulse on Pin 3 and a negative pulse on Pin 1 selects the HOLD mode.

### FEATURES

- 35 nSec maximum acquisition time to 0.01%
- 30 nS max. hold mode settling to 0.01%
- 1 pSec aperture uncertainty
- 75 MHz small-signal bandwidth
- 520 mW maximum power dissipation
- Small 14-pin DIP package
- CMOS control signal

### GENERAL DESCRIPTION

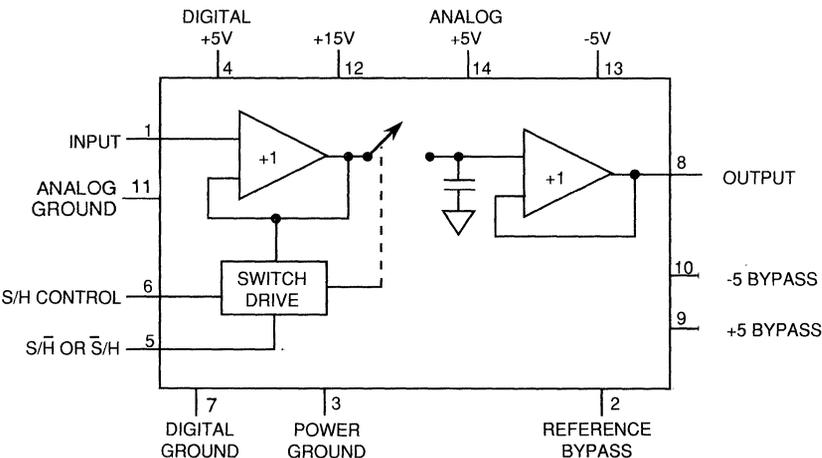

The SHM-43 sample-hold utilizes a proprietary architecture in delivering an acquisition time of 35 nanoseconds maximum to 0.01% and 20 nanoseconds maximum to 0.1% accuracy.

Operation requires  $\pm 15$  and  $\pm 5$ V supplies and the analog input range is  $\pm 2$ V. Packaged in a small 14-pin DIP, the SHM-43 offers a CMOS compatible sample command while dissipating just 500 milliwatts.

The SHM-43 has been designed for applications that demand fast acquisition times (25 nS .01%), fast hold mode settling (20nS .01%), wide band width, and the ability to drive resistive (100 $\Omega$ ), and capacitive (60pF) loads with no compromise in performance. These features make the SHM-43 an ideal choice for driving flash A/D converters in applications such as radar and communications.

Two temperature ranges are offered; the commercial 0 to +70  $^{\circ}$ C and military -55 to +125  $^{\circ}$ C.

| PIN | FUNCTION                 |
|-----|--------------------------|
| 1   | INPUT                    |

| 11  | ANALOG GROUND            |
| 12  | +15V POWER               |
| 13  | -5V                      |
| 14  | ANALOG +5V               |

## ABSOLUTE MAXIMUM RATINGS

| PARAMETERS                 | LIMITS        | UNITS |
|----------------------------|---------------|-------|
| +15V Supply (pin 12)       | -0.5 to +18   | V dc  |
| +5V Supply (pin 4, 14)     | -0.5 to +7    | V dc  |
| -5V Supply (pin 13)        | +0.5 to -7    | V dc  |
| Analog Inputs (pin 1)      | +5V Supply -1 | V dc  |
|                            | +5V Supply +1 | V dc  |
| Digital Inputs (pins 5,6)  | -0.5 to +7    | V dc  |
| Lead Temperature (10 sec.) | 300 Max.      | °C    |
| Short circuit to ground    | 70            | mA    |

Output shorted to any supply will cause permanent damage.

## FUNCTIONAL SPECIFICATIONS

Apply over the operating temperature range and over the operating power supply range unless otherwise specified.

## TECHNICAL NOTES

1. Bypass the +5V analog, +5V digital, +15V supplies with a 1µF, 25V tantalum capacitor in parallel with a 0.01 µF ceramic capacitor mounted as close to the pin as possible.
2. Additional bypass capacitors are necessary, because of internal high switching speeds, and high slew rates of internal components. These additional points (pin 2-REFERENCE, pin 9, +5V, pin 10.-5V) are internal connections that must be bypassed with a minimum of a 1µF tantalum (polarity of connections are shown on the test circuit drawing) capacitor mounted as close to the pin as possible.
3. As with all high speed analog circuits, it is essential that good grounding techniques be used. Tie all ground pins together at a single ground point beneath the device, and use a short low impedance run to the ground of the analog power supplies. The ground point should be a solid ground plane under the device and any associated converter.
4. The offset, pedestal and gain errors of the SHM-43 are laser trimmed at DATEL and no external compensation capabilities have been provided. This prevents introducing noise through the offset adjust terminals of the S/H amplifier and guarantees excellent gain linearity, offset drift, and pedestal performance.

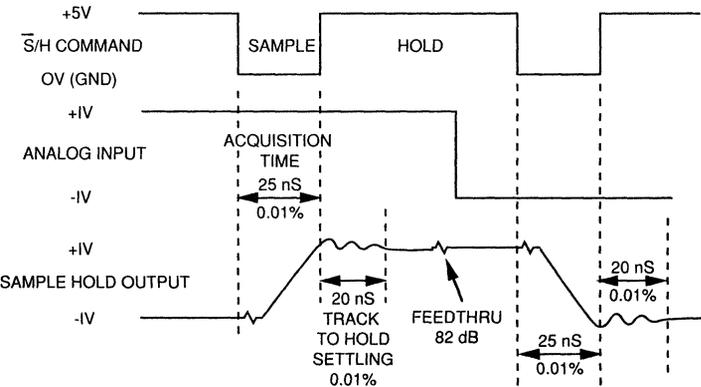

TEST CIRCUIT CONNECTIONS

\* Connections shown for  $\bar{S}/H$ , if opposite polarity sample hold command is desired, connect pin 6 to +5V (pin 4). Using opposite polarity, S/H command will *not* effect speed or accuracy.

\* The SHM-43 has been optimised for driving 100Ω loads, R<sub>1</sub> should be chosen so that the total load on the S/H is 100Ω.

TEST METHOD

ORDERING GUIDE

| MODEL NUMBER | TEMP. RANGE    |
|--------------|----------------|
| SHM-43MC     | 0 to +70 °C    |
| SHM-43MM     | -55 to +125 °C |

### FEATURES

- Ideally suited for DATEL's Ultra-fast ADC-500/505 A/D converters
- 200 nSec Maximum acquisition time
- 0.01% accuracy
- 100 nSec Maximum sample-hold settling time
- 74 dB Feedthrough attenuation
- $\pm 50$  pSec Aperture uncertainty
- Operable at different gain settings

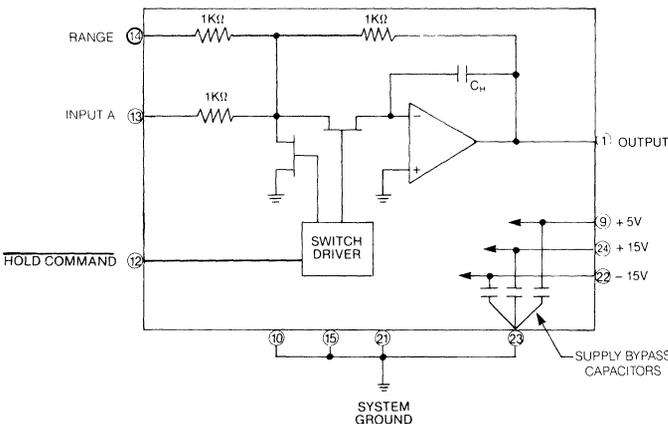

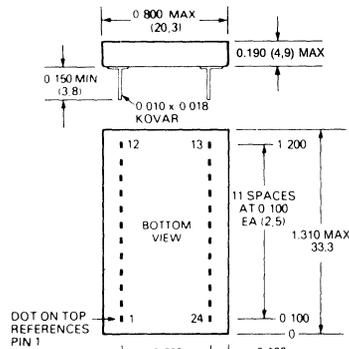

### GENERAL DESCRIPTION

DATEL's SHM-45 is a high-speed, high accuracy sample-hold designed for precision, high-speed analog signal processing applications. Manufactured with modern, high quality hybrid technology, the SHM-45 features excellent dynamic specifications including a maximum acquisition time of only 200 nSec for a 10V step to 0.01%. Sample-to-hold settling time to 0.01% accuracy is 100 nSec maximum with an aperture uncertainty of  $\pm 50$  pSec.

The SHM-45 is a complete sample-hold circuit, containing a precision MOS hold capacitor and a MOSFET switching configuration which results in faster switching and better feedthrough attenuation. Additionally, an FET input amplifier design allows faster acquisition and settling times while maintaining a considerably lower droop rate.

**Footnotes**

1. Input signal times gain should not exceed the output voltage range.
2. The SHM-45 output is current limited at approximately ±65 mA. The device can withstand a sustained short to ground. However, shorts to either supply will cause permanent damage.
3. Sample-to-Hold offset error (Pedestal) is constant regardless of input/output level.
4. FS is defined as 10 Volts.

**TECHNICAL NOTES**

1. All ground pins (10, 15, 21, 23) should be tied together and connected to system analog ground as close to the package as possible. It is recommended to use a ground plane under the device and solder all four ground pins directly to it. Care must be taken to insure that no ground potentials can exist between pin 10 and the other ground pins.
2. Although the power supply pins (9, 22, 24) are internally bypassed to ground with 0.01 µF ceramic capacitors, additional external 0.1 µF to 1 µF tantalum bypass capacitors may be required in critical applications.
3. A logic 1 on the HOLD COMMAND input, pin 12 will put the device in the sample mode. In this mode, the device acts as an inverting unity gain amplifier and its output will track its input. A logic 0 on pin 12 will put the device in the hold mode, and the output will be held constant at the last input level present when the hold command was given.
4. The maximum capacitive load to avoid oscillation is typically 250 pF. Recommended resistive load is 500Ω, although values as low as 250Ω may be used. Acquisition and sample-to-hold settling times are relatively unaffected by resistive loads down to 250Ω and capacitive loads up to 50 pF. However, higher capacitances will affect both acquisition and settling time.
5. The RANGE pin of the SHM-45 is unable to select different output voltage ranges. The output voltage ranges are selectable by hardware programming the SHM-45 to operate at different gains. Table 1 shows the range selection details.

**Table 1. Jumper Selections for V<sub>OUT</sub> Ranges**

| V <sub>IN</sub> | V <sub>OUT</sub> | Connect Pins | Operating Gain |
|-----------------|------------------|--------------|----------------|
| -5 to +5        | +10 to -10       | 13 to 14     | -2             |
| -10 to +10      | +10 to -10       | -            | -1             |
| 0 to -5         | 0 to +10         | 13 to 14     | -2             |
| 0 to -10        | 0 to +10         | -            | -1             |
| -10 to +10      | +5 to -5         | 1 to 14      | -0.5           |
| 0 to -10        | 0 to +5          | 1 to 14      | -0.5           |

### FEATURES

- 200 Nanoseconds maximum acquisition time
- 0.01% Accuracy
- 100 Nanoseconds maximum sample-hold settling time
- 74 dB Feedthrough attenuation
- $\pm 50$  Picoseconds aperture uncertainty

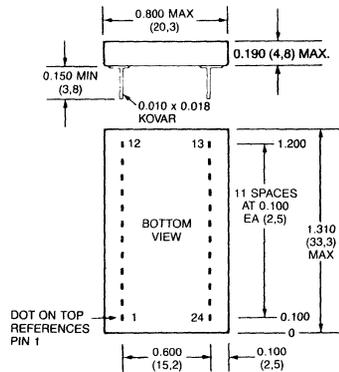

### GENERAL DESCRIPTION

DATEL's SHM-4860 is a high-speed, highly accurate sample-hold designed for precision, high-speed analog signal processing applications. Manufactured using modern, high-quality hybrid technology, the SHM-4860 features excellent dynamic specifications including a maximum acquisition time of only 200 nanoseconds for a 10V step to 0.01%. Sample-to-hold settling time, to 0.01% accuracy, is 100 nanoseconds maximum with an aperture uncertainty of  $\pm 50$  picoseconds.

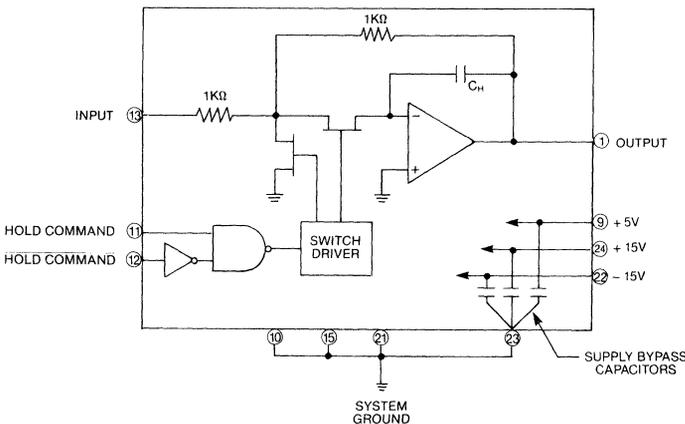

The SHM-4860 is a complete sample-hold circuit, containing a precision MOS hold capacitor and a MOSFET switching configuration which results in faster switching and better feedthrough attenuation. Additionally, an FET input amplifier design allows faster acquisition and settling times while maintaining a considerably lower droop rate.

### Footnotes

- Input signal should not exceed the supply voltage.
- The SHM-4860's output is current limited at approximately ±65 mA. The device can withstand a sustained short to ground. However, shorts from the output to either supply will cause permanent damage. For normal operation the load current should not exceed ±40 mA.
- Full Scale (FS) = 10V. Full Scale Range (FSR) = 20V.
- Sample-to-Hold offset error (Pedestal) is constant regardless of input/output level.

### ABSOLUTE MAXIMUM RATINGS

|  |                |
|--|----------------|
| ±15V Supply Voltage (Pins 24, 22) . . . . .  | ±18V           |
| +5V Supply Voltage (Pin 9) . . . . .         | -0.5V to +7V   |
| Analog Input (Pin 13) <sup>1</sup> . . . . . | ±18V           |
| Digital Input (Pins 11, 12) . . . . .        | -0.5V to +5.5V |
| Output Current <sup>2</sup> . . . . .        | ±65 mA         |

### TECHNICAL NOTES

- All ground pins (10, 15, 21, 23) should be tied together and connected to system analog ground as close to the package as possible. It is recommended to use a ground plane under the device and solder all four ground pins directly to it. Care must be taken to insure that no ground potentials can exist between Pin 10 and the other ground pins.
- Although the power supply pins (9, 22, 24) are internally bypassed to ground with 0.01 μF ceramic capacitors, additional external 0.1 μF to 1 μF tantalum bypass capacitors may be required in critical applications.
- A logic "0" on the HOLD COMMAND INPUT, (Pin 11) (or a logic "1" on the HOLD COMMAND INPUT, Pin 12) will put the device in the sample mode. In this mode, the device acts as an inverting unity gain amplifier and its output will track its input. A logic "1" on Pin 11 (logic "0" on Pin 12) will put the device in the HOLD mode, and the output will be held constant at the last input level present when the hold command was given.  
If the HOLD COMMAND INPUT (Pin 11) is used to control the device, Pin 12 must be tied to digital ground. If HOLD COMMAND INPUT (Pin 12) is used to control the device, Pin 11 must be tied to +5V.
- The maximum capacitive load to avoid oscillation is typically 250 pF. Recommended resistive load is 500Ω, although values as low as 250Ω may be used. Acquisition and sample-to-hold settling times are relatively unaffected by resistive loads down to 250Ω and capacitive loads up to 50 pF. However, higher capacitances will affect both acquisition and settling time.

## SHM-6 0.02%, 2.0 Microseconds Microelectronic Sample-hold

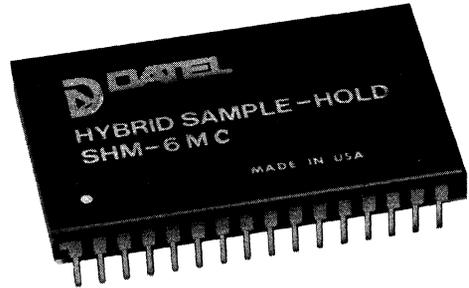

### FEATURES

- 0.02% Accuracy
- 2.0 Microseconds acquisition time
- 2 Nanoseconds aperture uncertainty
- 5 MHz Bandwidth, small signal
- 25 mA Output current
- Gain-programmable from  $\pm 1$  to  $\pm 10$

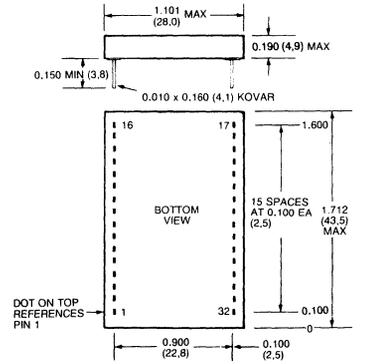

### GENERAL DESCRIPTION

DATEL's SHM-6 is a high-speed, high accuracy sample-hold circuit manufactured with thin-film hybrid technology. This design offers the speed and performance of modular sample-holds with the compactness and integrity of advanced hybrid techniques. The unit's excellent high-speed characteristics include a guaranteed acquisition time of 700 nanoseconds to 0.1% accuracy and 2.0 microseconds to 0.02% for a 10 volt change.

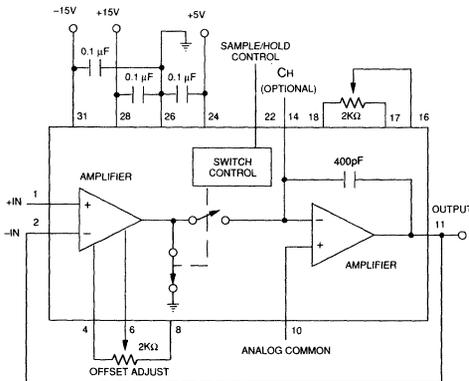

The SHM-6 is a complete sample-hold containing a precision MOS holding capacitor. The input amplifier is an open loop transductance amplifier which can be externally connected for closed loop gains from  $\pm 1$  to  $\pm 10$ . In addition to its speed, accuracy and selectable gain, the SHM-6 has an output capability of 25 mA. These features allow this unit to offer an unusual degree of adaptability.

| Weight                              | 0.5 Ounce (14 grams)  |

**TECHNICAL NOTES**

1. It is essential that the +15V, -15V, and +5V supplies, pins 28, 31, and 24 respectively, each be bypassed to ground with a 0.1  $\mu$ F ceramic capacitor connected as close to the pins as possible.
2. Digital Common, pin 26, and Analog Common, pin 10, are not connected together internally, therefore they must be connected externally as directly as possible.
3. An external holding capacitor can be added to decrease hold mode voltage droop but with consequently long acquisition time.
4. In the inverting unity gain operating mode, the feedback and input resistors should be carefully matched or trimmed to yield the desired gain of one. In general, the operating parameters are the same as the noninverting unity gain configuration, except that the sampling bandwidth is reduced by a factor of two. For applications of the SHM-6 with gain greater than one, sampling bandwidth is inverse-proportional to gain.
5. Capacitive loads on the output should be limited to 100 pF to maximize acquisition time. The SHM-6 has a ±25 mA current drive capability.
6. The adjustment procedures for the SHM-6 are as follows. Ground the input pin and connect the output to a D.V.M.; operate the offset adjustment potentiometer to yield an output of zero as read on the D.V.M. The sample-hold step adjustment is performed with the input pin grounded and the output connected to an oscilloscope set to 1 mV/cm sensitivity. The digital input pin is driven with a compatible square wave at approximately 250 KHz and the sample-hold step adjustment potentiometer is operated to produce a flat-line output on the oscilloscope.
7. Trim pots should be 100 ppm/°C cermet type. Gain Resistors should be 100 ppm/°C, or better, metal film type.

**ORDERING INFORMATION**

| MODEL   | OPERATING TEMP. RANGE | SEAL     |
|---------|-----------------------|----------|
| SHM-6MC | 0 to +70 °C           | Hermetic |
| SHM-6MM | -55 to +100 °C        | Hermetic |

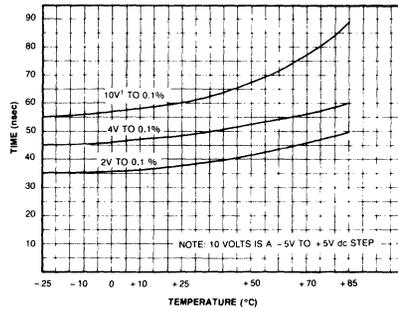

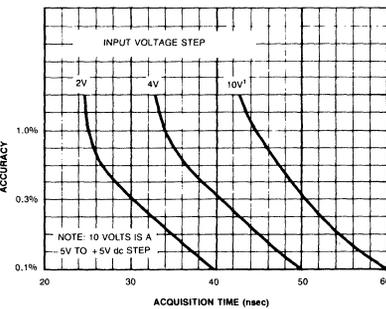

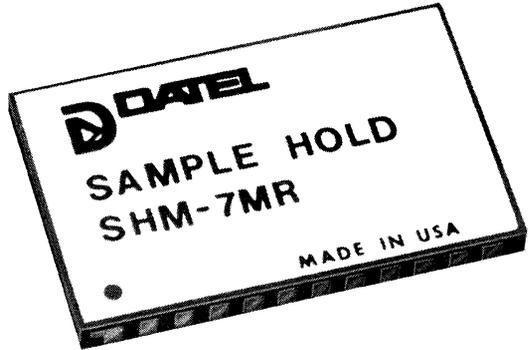

### FEATURES

- 40 Nanoseconds acquisition time
- Dual outputs
- 10 Picoseconds aperture uncertainty
- 40 MHz Bandwidth
- 30 mA Output current

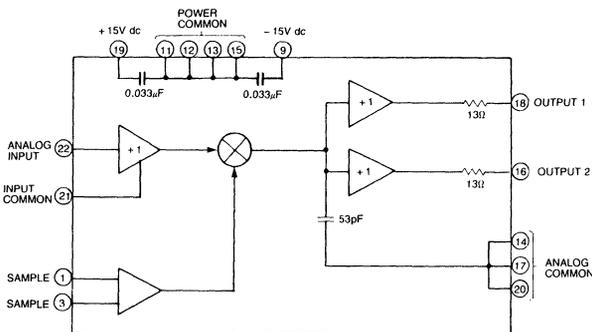

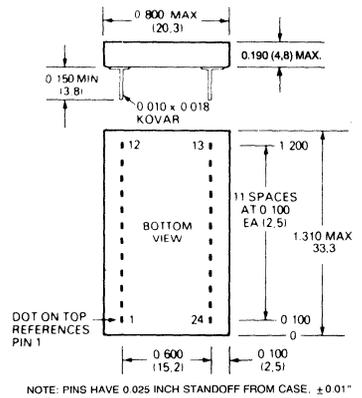

### GENERAL DESCRIPTION

DATEL's SHM-7 is an ultra-fast sample and hold designed for high-speed analog signal processing applications. The SHM-7 acquires a 2V dc input change to 0.1% in only 40 nanoseconds and aperture uncertainty time is less than 10 picoseconds. Sample-mode bandwidth is 40 MHz.

The SHM-7 is a complete sample-hold, containing an input buffer amplifier, a precision 53 pF MOS holding capacitor, and two output buffer amplifiers. The sampling switch is controlled by a series 10,000 complementary ECL input. An ECL differential line driver can be conveniently used for the sample control inputs.

### FEATURES

- Contains two precision sample-and-hold amplifiers
- Designed for use with 12- or 14-bit A/D converters
- Fast acquisition time (2  $\mu$ Sec to  $\pm$  0.002%)
- No external components required
- Wide temperature range (-55 to +125°C available)
- 24-pin dual in-line package
- Multiplexed inputs and outputs for application versatility

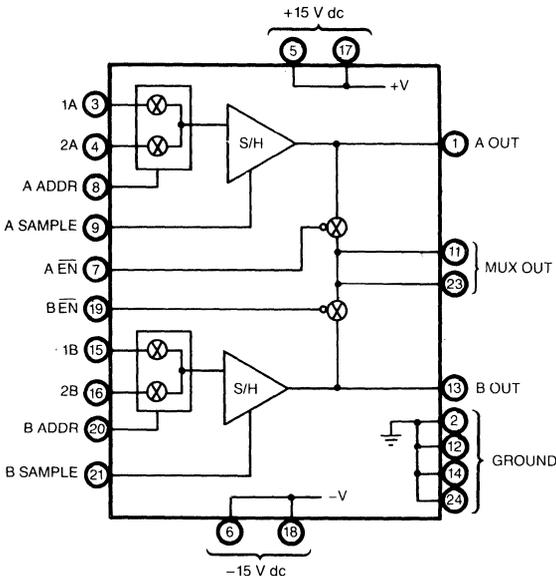

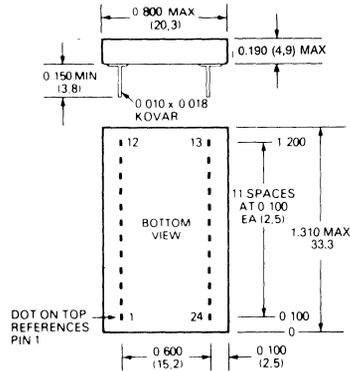

### GENERAL DESCRIPTION

DATEL's SHM-91 is a high performance/high resolution dual sample-and-hold amplifier. This hybrid device is designed for multi-channel analog signal processing applications with 12- to 14-bit accuracy requirements. Typical applications for this device would demand high speed and high resolution. The SHM-91 offers both of these features at a low cost.

The SHM-91 consists of two separate sample-and-hold amplifiers, each independently controlled to allow flexibility when implementing a system design. Each half consists of a two-channel input multiplexer and a sample-and-hold amplifier. The output of each sample-and-hold is available directly or through a multiplexed output.

- Specified at +25 °C.
- Tested at ±25 °C with input source impedance of 50 ohms.

## TECHNICAL NOTES

- All ground pins (2, 12, 14, 24) should be tied together and connected to system analog ground as close to the package as possible. It is recommended to use a ground plane under the device and solder all four ground pins directly to it. The power supply pins (5, 6, 17, 18) should be bypassed to analog ground with .01 µF ceramic capacitors located as close to the pins as possible. In certain critical applications, additional bypass precautions using 0.1 or 1.0 µF tantalum capacitors are suggested.
- A logic "1" on the sample pins (9; 21) will put this device in the sample mode. In this mode, the device acts as an unity gain amplifier and its output will track its input. A logic "0" on the sample pins (9, 21) will put the device in the hold mode, and the output will be held constant at the last input level present before the hold command was given.
- Care should be taken when using the multiplexer output pins (11, 23) that the A EN (pin 7) and the B EN (pin 19) are not active (logic 0) at the same time. This condition could possibly damage the device.
- The output of the SHM-91 should drive a high impedance receiver to minimize voltage divider losses. The receiver input impedance should be 100K ohms or greater when using the direct outputs from the amplifiers (pins 1 and 13). The receiver input impedance should be 2.5 M ohms or greater when using the multiplexer outputs (pins 11 and 23).
- The SHM-91 should not be left in the hold mode for long periods of time. It should be left in the sample mode when long or indeterminate periods of time are involved. If left in the hold mode for several seconds, the output will continue to "droop" toward the power supply voltage. Eventually the output amplifier will saturate. The unit will require longer than the specified acquisition time to acquire a signal when the output amplifiers are saturated.
- A Logic "1" on the A or B ADDR (Address) pins (8 and 20) will select channel 1A or 1B on the respective input mux. A Logic "0" will select 2A or 2B.

### FEATURES

- 500 nSec Maximum acquisition time to 0.00076%
- Differential input
- 0.0004% Linearity
- 16-Bit Performance over military temperature range
- Small 24-DDIP package
- Operates at different gain settings

### GENERAL DESCRIPTION

DATEL's SHM-945 is a precision, high-speed sample-and-hold featuring a maximum acquisition time of 500 nanoseconds to 0.00076% accuracy. Differential inputs are provided to reject common-mode signals found in applications requiring 16-bit accuracy. A range pin allows gain selections of -0.5, -1, and -2.

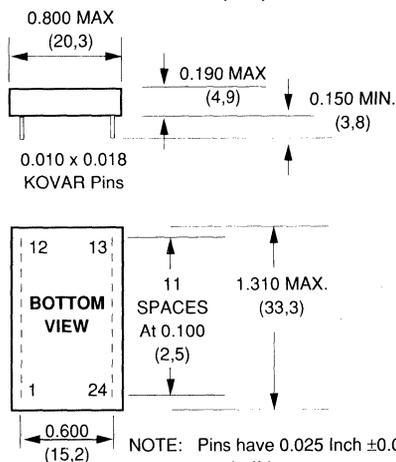

The SHM-945 contains an internal hold capacitor with internal compensation networks for pedestal error, feedthrough and dielectric absorption.

### TECHNICAL NOTES

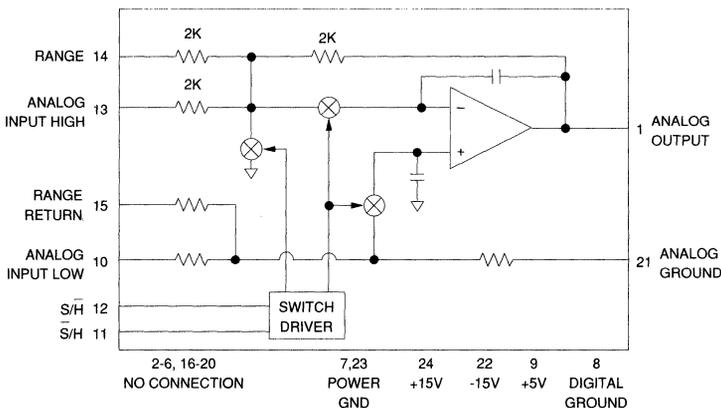

1. Bypass the  $\pm 15V$  and  $+5V$  supplies with a  $1 \mu F$ , 25V tantalum electrolytic capacitor in parallel with a  $0.01$  ceramic capacitor, mounted as close to the pin as possible.
2. Tie all ground pins together at a single ground point beneath the device and use a short, low impedance run to the ground of the analog power supplies. The ground point should be a solid ground plane under the sample/hold and data converter.
3. Differential amplifier - high-resolution applications frequently require the ability to sense ground at a distant signal source. To avoid errors due to different ground potential, use the SHM-945's analog input low (pin 10) to sense the ground at the signal source. In noisy applications, using shielded twisted pair wire, with one end of the shield tied to ground at the sample/hold, is recommended. Analog Input Low and Range Return (when used) must be  $\leq 100$  mV maximum with respect to Analog Ground.

### MECHANICAL DIMENSIONS

INCHES (mm)

NOTE: Pins have 0.025 Inch  $\pm 0.01$  stand-off from case.

① (DC to 1 MHz, 10V pk-pk).

- For a gain of -0.5, connect pin 14 (RANGE) to pin 1 (ANALOG OUTPUT) and tie pin 15 (RANGE RETURN) to ground.
- For a gain of -2, connect pin 14 to pin 13 (ANALOG INPUT) and tie pin 15 to ground.
- When using Sample/Hold (pin 11) connect pin 12 to Digital Ground. If using the Sample/Hold polarity (pin 12) tie pin 11 to +5V.
- The offset, pedestal, and gain errors of the SHM-945 are laser trimmed at DATEL and no external compensation capabilities have been provided. This prevents introducing noise through the offset adjust terminals of the S/H amplifier and guarantees excellent gain linearity, offset drift, and pedestal performance.

## ORDERING INFORMATION

| MODEL NUMBER      | TEMP. RANGE    | SEAL     |
|-------------------|----------------|----------|
| <b>SHM-945 MC</b> | 0 to +70 °C    | Hermetic |
| <b>SHM-945 MM</b> | -55 to +125 °C | Hermetic |

For availability of MIL-STD-883 devices, contact DATEL.

## FEATURES

- 25 Nanoseconds acquisition time
- 50 MHz Bandwidth
- 10 Picoseconds aperture uncertainty
- Up to 8-bit accuracy
- $\pm 2.5V$  Input range

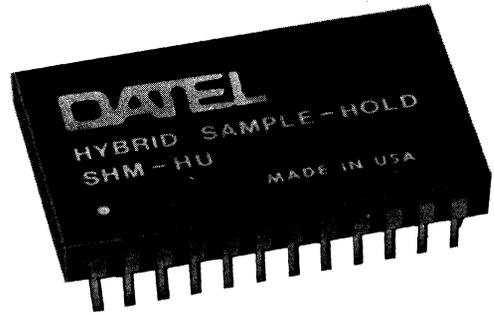

## GENERAL DESCRIPTION

DATEL's SHM-HU is an ultra high-speed sample-hold capable of video speed signal processing. The SHM-HU acquires a full-scale 5V input change in just 25 nanoseconds and features a 10 picoseconds aperture uncertainty time. Bandwidth is 50 MHz and the slew rate is 200 V/microseconds.

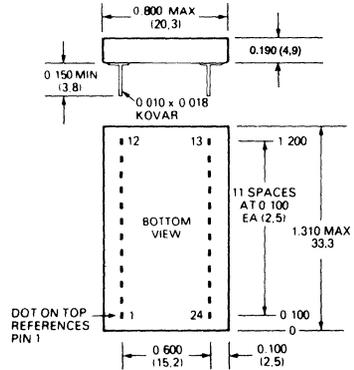

Through the use of thin-film hybrid construction, this ultra high-speed circuit is contained in a miniature 24-pin ceramic package. A 53 picofarad MOS hold capacitor is incorporated inside the package and provision is made for externally added capacitance when necessary. The sample-hold requires four external resistors and an LH0033 fast buffer amplifier for completion. The circuit is zeroed by adjustment of the LH0033 amplifier.

Other features of this unit include a  $\pm 2.5V$  input/output voltage range and a fixed gain of 0.0955. The sampling switch is controlled by a complementary series 10,000 ECL input. An ECL differential line driver can be conveniently used for the sample control inputs.

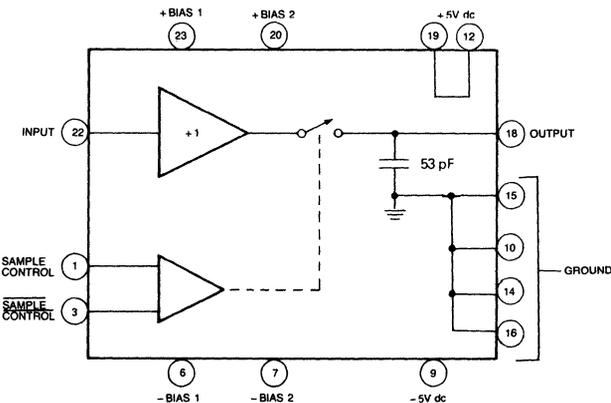

Power requirements are  $\pm 15V$  dc at 60 mA and  $\pm 5V$  dc at 70 mA. There are three basic models covering two operating temperature ranges, 0 to  $+70^\circ C$ , and  $-55$  to  $+100^\circ C$ .

## MECHANICAL DIMENSIONS INCHES (MM)

NOTE: PINS HAVE 0.025 INCH STANDOFF FROM CASE,  $\pm 0.01$ "

| FOOTNOTES:  |   |
| 1. Output is from LH0033 amplifier and is not short circuit proof.  |   |
| 2. Output offset voltage adjustable to zero by LH0033 offset adjustment.  |   |
| 3. ± 12V supplies can be used if the 360 ohm resistors at the Bias 1 pins are changed to 240 ohms and the 240 ohm resistors at the Bias 2 pins are changed to 160 ohms. |   |
| 4. The SHM-HU can be driven by TTL logic input by biasing SAMPLE CONTROL input to +1.2V and driving the SAMPLE CONTROL with a positive pulse for sampling mode.         |   |

## TECHNICAL NOTES

1. It is recommended that the ±5V supplies of the SHM-HU be bypassed with 0.1 μF ceramic capacitors as close as possible to pins 9 and 19. The ±15V supplies to the LH0033 should be bypassed with the same value capacitors.
2. It is essential that the output lead from pin 18 to pin 5 of the LH0033 be kept as short and direct as possible. Also, the complementary ECL driver should be as close as possible to pins 1 and 3 to minimize lead lengths to these pins.
3. With model SHM-HUMC the LH0033C should be used, and with model SHM-HUMM, model LH0033 should be used.
4. An external hold capacitor may be added from pin 18 to pin 15. This capacitor should be an MOS or polystyrene type. Hold mode Droop and sample-to-hold offset error will decrease proportionately with the size of this capacitor and acquisition time will increase proportionately.

### PRELIMINARY PRODUCT DATA

#### FEATURES

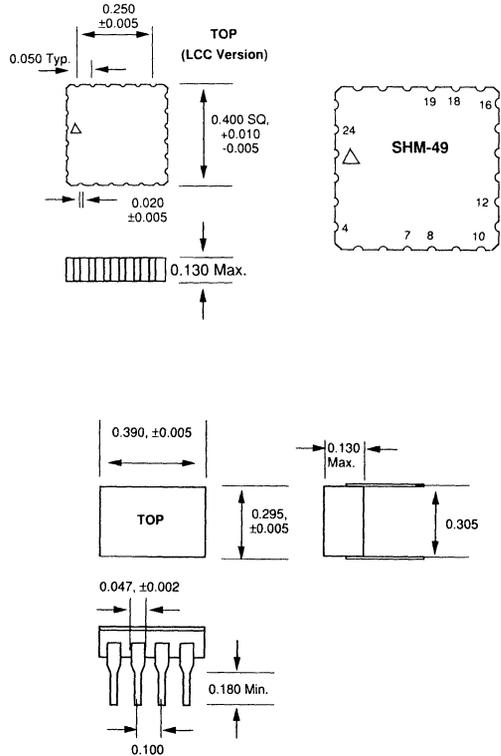

- 16 MHz small signal bandwidth
- Small 8 pin DIP or LCC package
- 200 nanoseconds maximum acquisition time to 0.01%
- 100 nanoseconds maximum sample/hold settling time to 0.01%
- 72 dB feedthrough attenuation
- $\pm 25$  picoseconds aperture uncertainty
- 413 mW maximum power dissipation

#### GENERAL DESCRIPTION

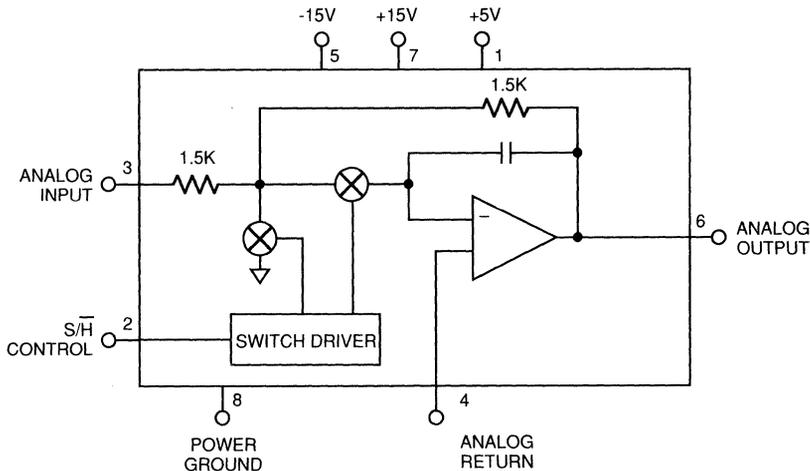

DATEL's SHM-49 is a high-speed, highly accurate sample/hold designed for precision, high-speed analog signal processing applications. Manufactured using modern, high-quality hybrid technology, the SHM-49 features excellent dynamic specifications including a maximum acquisition time of only 200 nanoseconds for a 10V step to 0.01%. Sample-to-hold settling time, to 0.01% accuracy, is 100 nanoseconds maximum with an aperture uncertainty of  $\pm 25$  picoseconds.

The SHM-49 is a complete sample/hold circuit, containing a precision MOS hold capacitor and a MOSFET switching configuration which results in faster switching and better feed-through attenuation. Additionally a FET input amplifier design allows faster acquisition and settling times while maintaining a considerably lower droop rate.

#### MECHANICAL DIMENSIONS

| SHM-49MM/LM                        | -55 to +125 °C |
| <b>Storage Temperature Range</b>   | -65 to +150 °C |
| <b>Package Type, DIP</b>           | 8 pin ceramic  |
| LCC                                | 24 pin ceramic |

## Footnotes

- One TTL load is defined as sinking 40 μA with a logic 1 input and sourcing 1.6mA with a logic 0 input.
- Full Scale (FS) = 10V. Full Scale Range (FSR) = 20V.
- Sample-to-Hold offset error (Pedestal) is constant regardless of input/output level.

## TECHNICAL NOTES

- All ground pins should be tied together and connected to system analog ground as close to the package as possible. It is recommended to use a ground plane under the device and solder ground pins directly to it. Care must be taken to insure that no ground potentials can exist between ground pins.
- External 0.1 μF to 1 μF tantalum bypass capacitors are required in critical applications.
- A logic 1 on S/H puts the unit in the track mode. A logic 0 puts the unit in hold mode.
- The maximum capacitive load to avoid oscillation is typically 250 pF. Recommended resistive load is 500Ω, although values as low as 250Ω may be used. Acquisition and sample-to-hold settling times are relatively unaffected by resistive loads down to 250Ω and capacitive loads up to 50 pF. However, capacitances will affect both acquisition and settling time.

## Offset and Gain Adjustments

NOTE: with a precision source, adjust R1 and R2 so that the output of the SHM-49 in the hold mode matches the source output.

## ORDERING INFORMATION

| MODEL NO. | OPERATING TEMP. RANGE |
|-----------|-----------------------|
| SHM-49MC  | 0 to +70 °C           |
| SHM-49LC  | 0 to +70 °C           |
| SHM-49MM  | -55 to +125 °C        |
| SHM-49LM  | -55 to +125 °C        |

For availability of High Reliability versions of the SHM-49, contact DATEL.

### FEATURES

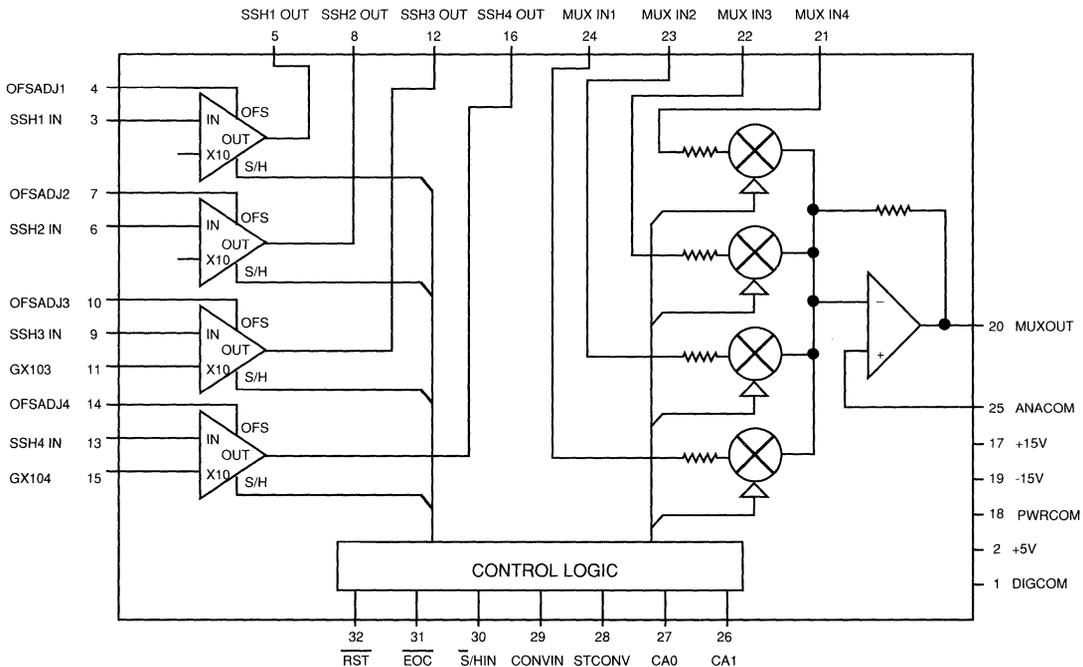

- 4 Simultaneous sample holds
- Internal 4-channel multiplexer
- 750 nSec. Acquisition time, 10V step to 0.01%
- 2 Channels with optional X10 gain
- Control logic for interfacing to A/D's
- Low power - 1.5 Watts
- Small 32-pin TDIP
- -55 °C to +125 °C Versions

### GENERAL DESCRIPTION

The MSH-840 is a quad simultaneous sample-hold featuring an acquisition time of 750 nSec. Control logic is provided for strobing the channels simultaneously and for interfacing to A/D's. A 4-channel multiplexer allows individual S/H outputs to be digitized.

The MSH-840 requires +/-15V and +5V power supplies and dissipates just 1.5 Watts. Packaged in a small 32-pin TDIP, both commercial 0 to +70 °C and military -55 to +125 °C operating temperature range models are offered.

### FEATURES

- Miniature 63-pin hermetic package
- 12-Bit resolution, 50 KHz
- Full-scale gain range of 50 mV to 10V
- Three-state outputs
- 16 Channels single-ended or 8 channels differential
- Auto-sequencing channel addressing
- MIL-STD-883 versions
- No missing codes

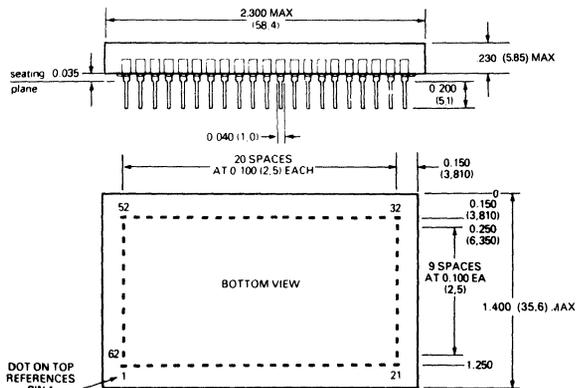

### GENERAL DESCRIPTION

Using thin-and thick-film hybrid technology, DATEL offers complete low-cost data acquisition systems with superior performance and reliability.

The HDAS-8 (with 8 differential input channels), and the HDAS-16 (with 16 single-ended input channels), are complete high performance 12-bit data acquisition systems in 62-pin packages. Each HDAS may expand to 32 single-ended or 16 or more differential channels by adding external multiplexers.

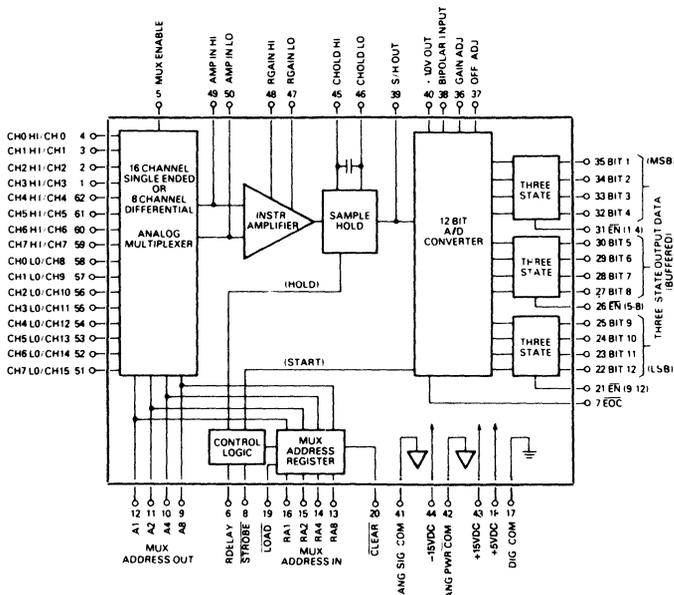

Internal channel address sequencing is automatic after each conversion, or the user may supply external channel addresses.

### MECHANICAL DIMENSIONS — INCHES (MM)

PIN SPACING IS 0.100 INCHES  $\pm 0.005$  NON-CUMULATIVE (2.5 mm)

MAXIMUM PIN DIMENSIONS ARE 0.012  $\times$  0.022 INCHES (0.3  $\times$  0.5 mm)

### Internal HDAS circuitry includes:

- Analog signal multiplexer
- Resistor programmable gain instrumentation amplifier
- A sample-and-hold-circuit, complete with MOS hold capacitor
- A 10 volt buffered reference
- A 12-bit A/D converter with three-state outputs and control logic

| ABSOLUTE MAXIMUM RATINGS |      |      |          |
|--------------------------|------|------|----------|
| Parameters               | Min. | Max. | Units    |
| +15V Supply (Pin 43)     | -0.5 | +18  | Volts dc |
| -15V Supply (Pin 44)     | +0.5 | -18  | Volts dc |
| +5V Supply (Pin 18)      | -0.5 | +7   | Volts dc |
| Analog Inputs (Note 1)   | -35  | +35  | Volts    |
| Digital Inputs           | -0.5 | +7   | Volts    |
| Thermal Resistance       |      |      |          |
| Junction-Case            |      | 13   | °C/Watt  |
| Case-Ambient             |      | 17   | °C/Watt  |
| Junction-Ambient         |      | 30   | °C/Watt  |
| Power Dissipation        |      | 1.75 | Watts    |
| Lead Temp. (10 Sec.)     |      | 300  | °C       |

## FUNCTIONAL SPECIFICATIONS

The following specifications apply over the operating temperature range and power supply range unless otherwise indicated.

| ANALOG INPUTS                                  | MIN.                                 | TYP.             | MAX. | UNITS  |
|--|--------------------------------------|------------------|------|--------|
| <b>Signal Range</b>                            |                                      |                  |      |        |

**SPECIFICATION NOTES**

- Analog inputs will withstand  $\pm 35$  volts with power on. If the power is off, the maximum safe input (no damage) is  $\pm 20$  volts.
- The gain equation error is guaranteed before external trimming and applies at gains under 50. This error increases at gains over 50.
- Adjustable to zero.
- STROBE pulse width must be smaller than  $\overline{EOC}$  period to achieve maximum throughput rate.

**TECHNICAL NOTES**

- Input channels are protected to 20 volts beyond the power supplies. All digital output pins have one second short circuit protection; CHOLD has a ten second short circuit protection.
- To retain high system throughput rate while digitizing low level signals, apply external high-gain amplifiers for each channel. Datel's AM-551 is suggested for such amplifier-per-channel applications.
- The HDAS devices have self-starting circuits for free-running sequential operation. If, however, in a power-up condition the supply voltage slew rate is less than 3V per microsecond, the free running state might not be initialized. Apply a negative pulse to the STROBE, to eliminate this condition.
- For unipolar operation, connect BIPOLAR INPUT (pin 38) to S/H OUT (pin 39). For bipolar operation, connect BIPOLAR INPUT (pin 38) to +10V REFERENCE OUT (pin 40).
- RDELAY may be a standard value 5% carbon composition or film type resistor.
- RGAIN must be very accurate with low temperature coefficients. If necessary, fabricate the gain resistor from a precision metal film type in series with a low value trim resistor or potentiometer. The total resistor temperature coefficient must be no greater than  $\pm 10$  ppm/°C.

**PIN CONNECTIONS**

| 62      | CH4 IN                    | CH4 HIGH IN |

\* Same as HDAS-16

- Caution: pins 49 and 50 do not have overvoltage protection; therefore, protected multiplexers, such as DATEL's MX-1606 and MX-808 are recommended. See the General Operation description.

**Table 1. Description of Pin Functions**

| FUNCTION                | LOGIC STATE | DESCRIPTION   |
|-------------------------|-------------|---|
| <b>DIGITAL INPUTS</b>   |             |   |
| STROBE                  | 1 to 0      | Initiates acquisition and conversion of analog signal   |
| LOAD                    | 0           | Random Address Mode Initiated on falling edge of STROBE   |
|                         | 1           | Sequential Address Mode   |
| CLEAR                   | 0           | Allows next STROBE pulse to reset MULTIPLEXER ADDRESS to CH0 overriding LOAD COMMAND  |
| MULTIPLEXER ENABLE      | 0           | Disables internal MULTIPLEXER   |
|                         | 1           | Enables internal MULTIPLEXER  |
| MULTIPLEXER ADDRESS IN  |             | Selects channel for Random Address Mode 8, 4, 2, and 1 natural binary coding  |
| <b>DIGITAL OUTPUTS</b>  |             |   |
| EOC                     |             | End of Conversion (STATUS)  |
|                         | 0           | Conversion complete   |
|                         | 1           | Conversion in process   |
| ENABLE (1-4)            | 0           | Enables three-state outputs bits 1-4  |
|                         | 1           | Disables three-state outputs bits 1-4   |
| ENABLE (5-8)            | 0           | Enables three-state outputs bits 5-8  |
|                         | 1           | Disables three-state outputs bits 5-8   |
| ENABLE (9-12)           | 0           | Enables three-state outputs bits 9-12   |
|                         | 1           | Disables three-state outputs bits 9-12  |
| MULTIPLEXER ADDRESS OUT |             | Output of MULTIPLEXER Address Register 8, 4, 2, 1 natural binary coding   |
| <b>ANALOG INPUTS</b>    |             |   |
| Channel Inputs          |             | Limit voltage to $\pm 20V$ beyond power supplies  |
| Bipolar Input           |             | For unipolar operation, connect to pin 39 (S/H OUT)<br>For bipolar operation, connect to pin 40 (+10V OUT)  |
| AMP. IN HIGH            |             | These pins are direct inputs to the instrumentation amplifier for external channel expansion beyond 16SE or 8D channels.                                      |
| AMP. IN LOW             |             |   |
| <b>ANALOG OUTPUTS</b>   |             |   |
| S/H OUT                 |             | Sample/Hold Output  |
| +10V OUT                |             | Buffered +10V reference output  |
| <b>ADJUSTMENT PINS</b>  |             |   |
| ANALOG SIGNAL COMMON    |             |   |
| COMMON                  |             | Low level analog signal return  |
| GAIN ADJUSTMENT         |             | External gain adjustment, see calibration instructions.   |
| OFFSET ADJUSTMENT       |             | External offset adjustment. See calibration instructions.   |
| R GAIN                  |             | Optional gain selection point. Factory adjusted for G = 1 when left open.   |
| C HOLD                  |             | Optional hold capacitor connection.   |
| R DELAY                 |             | Optional acquisition time adjustment when connected to +5V, factory adjusted for 9 $\mu$ Sec. Must be connected to +5V either directly or through a resistor. |

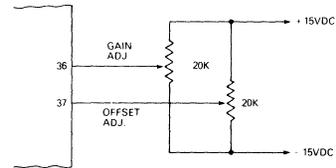

- ANALOG SIGNAL COMMON, POWER COMMON, and DIGITAL COMMON are connected internally. Avoid ground-related problems by connecting the commons to one point . . . the ground plane beneath the converter when the above special grounding considerations do not apply.
- For HDAS-16, tie pin 50 to a "signal source common" if possible. Otherwise tie pin 50 to pin 41 (ANA SIGN COM).

**Table 2. Calibration Table**

| UNIPOLAR RANGE       | ADJUST      | INPUT VOLTAGE        |
|----------------------|-------------|----------------------|
| 0 TO +5V             | ZERO GAIN   | +0.6 mV<br>+4.9982V  |
| 0 TO +10V            | ZERO GAIN   | +1.2 mV<br>+9.9963V  |
| <b>BIPOLAR RANGE</b> |             |                      |
| $\pm 2.5V$           | OFFSET GAIN | -2.4994V<br>+2.4982V |
| $\pm 5V$             | OFFSET GAIN | -4.9988V<br>+4.9963V |
| $\pm 10V$            | OFFSET GAIN | -9.9976V<br>+9.9927V |

**CALIBRATION PROCEDURES**

- Offset and gain adjustments are made by connecting two 20K trim potentiometers as shown in Figure 1.
- Connect a precision voltage source to pin 4 (CH0 IN). If the HDAS-8 is used, connect pin 58 (CH0 LOW IN) to analog ground. Ground pin 20 (CLEAR) and momentarily short pin 8 (STROBE). Trigger the A/D by connecting pin 7 (EOC) to pin 8 (STROBE). Select proper value for RGAIN and RDELAY by referring to Table 3.
- Adjust the precision voltage source to the value shown in Table 2 for the unipolar zero adjustment (ZERO + 1/2 LSB) or the bipolar offset adjustment (-FS + 1/2 LSB). Adjust the offset trim potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001.
- Change the output of the precision voltage source to the value shown in Table 2 for the unipolar or bipolar gain adjustment (+FS - 1/2 LSB). Adjust the gain trim potentiometer so that the output flickers equally between 1111 1111 1110 and 1111 1111 1111.

**Figure 1. External Adjustment**

**GENERAL OPERATION**

The HDAS devices accept either 16 single-ended or 8 differential input signals. For single-ended circuits, the AMP IN LOW (pin 50) input to the instrumentation amplifier must terminate at ANALOG SIGNAL COMMON (pin 41). For differential circuits, both the HIGH and LOW signal inputs must terminate externally for each channel. Tie unused channels to the ANALOG SIGNAL COMMON (pin 41). To obtain additional channels, connect external multiplexers to the AMP IN HIGH (pin 49) and AMP IN LOW (pin 50). Using this scheme, the HDAS-16 can provide 32 single-ended expansion channels while the HDAS-8 can provide up to 16 differential expansion channels. DATEL multiplexer MX-1606 is recommended.

The acquisition time is the amount of time the multiplexer, instrumentation amplifier, and Sample/Hold require to settle within a specified range of accuracy after STROBE (pin 8) goes low. The acquisition time period can be observed by measuring how long EOC is low after the falling edge of STROBE (see

**Table 3. Input Range Parameters (Typical)**

| INPUT RANGE  | GAIN | RGAIN ( $\Omega$ ) | ACQUISITION AND SETTLING DELAY | RDELAY ( $\Omega$ ) | THROUGHPUT | SYSTEM ACCURACY (%of FSR) |
|--------------|------|--------------------|--------------------------------|---------------------|------------|---------------------------|
| $\pm 10V$    | 1    | OPEN               | 9 $\mu$ Sec.                   | 0 (SHORT)           | 55.5 KHz   | 0.009%                    |

**NOTES**

$$RGAIN (\Omega) = \frac{20,000}{(GAIN-1)} \quad RDELAY (\Omega) = \frac{(\text{Delay } \mu\text{sec.} \times 1000)}{GAIN} - 9000$$

- For gains between 1 and 10, RDELAY (pin 6) must be shorted to +5V (pin 18).
- Throughput period equals Acquisition and Settling Delay, plus A/D conversion period (10 microseconds maximum).
- The analog input range to the A/D converter is 0 to +10V for unipolar signals, and -10.0V to +10.0V for bipolar signals.
- Full-scale can be accommodated for analog signal ranges of  $\pm 50mV$  to  $\pm 10V$ .

Figure 2). For higher gains increase the acquisition time. Do this by connecting a resistor from RDELAY (pin 6) to +5V (pin 18). An external resistor RGAIN, can be added to increase the gain value. The gain is equal to 1 without an RGAIN resistor. Table 3 refers to the appropriate RDELAY and RGAIN resistors required for various gains.

The HDAS devices enter the hold mode and are ready for conversion as soon as the one-shot (controlling acquisition time) times out. An internal clock is gated ON, and start-convert pulse is sent to the 12-bit A/D converter, driving the EOC output high.

The HDAS devices can be configured for either bipolar or unipolar operation (see Table 2). The conversion is complete within a maximum of 10 microseconds. The EOC now returns low, the data is valid and sent to the three-state output buffers. The sample/hold amplifier is now ready to acquire new data. The next falling edge of the STROBE pulse repeats the process for the next conversion.

\*For 2's complement — add inverter to MSB line.

**MULTIPLEXER ADDRESSING**

The HDAS devices can be configured in either random or sequential addressing modes. Refer to Table 5 and the subsequent descriptions. The number of channels sequentially addressed can be truncated using the MUX ADDRESS OUT (pins 9, 10, 11 and 12) and appropriate decoding circuitry for the highest channel desired. The decoding circuit can drive the CLEAR (pin 20) function low to reset the addressing to channel 0.

**RANDOM ADDRESS**

Set pin 19 (LOAD) to logic 0. The next falling edge of STROBE will load the MUX CHANNEL ADDRESS present on pin 13 to pin 16. Digital address inputs must be stable 20 nanoseconds before and after falling edge of STROBE pulse.

**FREE RUNNING SEQUENTIAL ADDRESS**

Set pin 19 (LOAD) and pin 20 (CLEAR) to logic 1 or leave open. Connect pin 7 (EOC) to pin 8 (STROBE). The falling edge of EOC will increment channel address. This means that when the EOC is low, the digital output data is valid for the previous channel (CHn - 1) than the channel indicated on MUX ADDRESS OUTPUT. The HDAS will continually scan all channels.

*Example:*

CH4 has been addressed and a conversion takes place. The EOC goes low. That channel's data becomes valid, but MUX ADDRESS CODE is now CH5.

**TRIGGERED SEQUENTIAL ADDRESS**

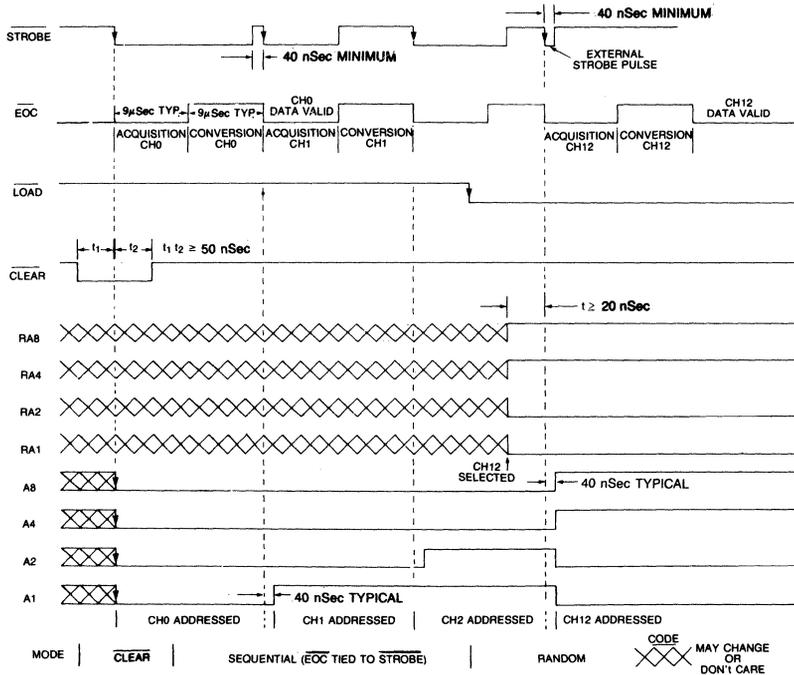

Set pin 19 (LOAD) and pin 20 (CLEAR) to logic 1 or leave open. Apply a falling edge trigger pulse to pin 8 (STROBE). This negative transition causes the contents of the address counter to be incremented by one, followed by an A/D conversion in 9 microseconds.

**Table 5. Mux Channel Addressing**

HDAS-8 (3-BIT ADDRESS)

HDAS-16 (4-BIT ADDRESS)

**Figure 2. HDAS Timing Diagram**

## INPUT VOLTAGE PROTECTION

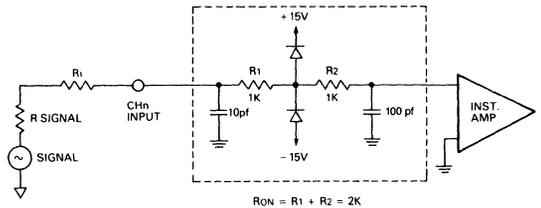

As shown in Figure 3, the multiplexer has reversed biased diodes which protect the input channels from being damaged by over-voltage signals. The HDAS input channels are protected up to 20V beyond the supplies and can be increased by adding series resistors ( $R_i$ ) to each channel. The input resistor must limit the current flowing through the protection diodes to 10 mA.

The value of  $R_i$  for a specific voltage protection range ( $V_p$ ) can be calculated by the following formula:

$$V_p = (R_{\text{signal}} + R_i + R_{\text{on}}) (10 \text{ mA})$$

where  $R_{\text{ON}} = 2\text{K}$

NOTE: Increased input series resistance will increase multiplexer settling time significantly.

**Figure 3. Multiplexer Equivalent Circuit**

## ORDERING INFORMATION

### MODEL

HDAS-16MC  
 HDAS-16MM  
 HDAS-16/883B  
 HDAS-8MC  
 HDAS-8MM  
 HDAS-8/883B

### OPERATING TEMP. RANGE

0°C to + 70°C  
 -55°C to + 125°C  
 -55°C to + 125°C  
 0°C to + 70°C  
 -55°C to + 125°C  
 -55°C to + 125°C

Receptacle for PC board mounting can be ordered through AMP Incorporated, #3-331272-4 (component lead spring socket) 62 required.

/883B Models are fully compliant to MIL-STD-883.

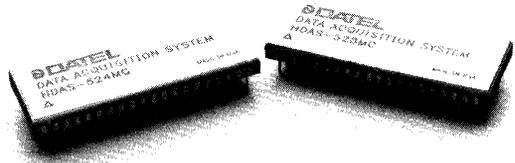

#### FEATURES

- 12-bit resolution, 400 KHz
- 8 channels single-ended or 4 channels differential
- Miniature 40-pin DDIP
- Full scale gain range from 100 mV to 10V
- Three-state outputs
- No missing codes

#### GENERAL DESCRIPTION

The HDAS-524,-528 are complete data acquisition systems containing an internal multiplexer, instrumentation amplifier, sample-and-hold, analog-to-digital converter and three-state outputs. Packaged in a miniature 40-pin double-dip package, the HDAS-524/528 has a low power dissipation of 2.6 watts.

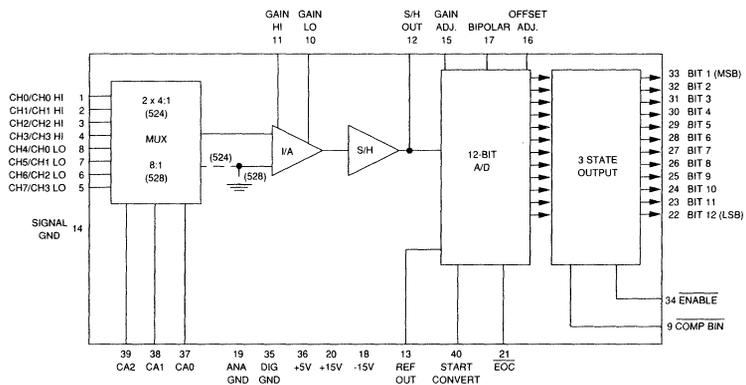

The HDAS-524 provides 4 differential inputs and the HDAS-528 provides 8 single-ended inputs. An internal instrumentation amplifier is characterized for gains of 1,2,4,8,10 and 100. The gain range is selectable through an external resistor.

#### TECHNICAL NOTES

1. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the analog, signal and digital grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies. This prevents contamination of the analog ground by noisy digital ground currents.

2. Double-level multiplexing allows expanding the multiplexer channel capacity of the HDAS-528 from 8 single-ended channels to 128 single-ended channels or the HDAS-524 from 4 differential channels to 32 single-ended channels.

① Specifications valid at 25 °C and over the temperature ranges of 0 to +70 °C and -55 to +125 °C.

TECHNICAL NOTES (CONT.)

3. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 9) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding, tie the COMP BIN pin to ground. The COMP BIN signal is compatible to CMOS/TTL logic levels for those users desiring logic control of this function.

4. To enable the three-state outputs, connect ENABLE (pin 10) to a logic "0" (low). To disable, connect ENABLE (pin 10) to a logic "1" (high).

HDAS-524/528 OPERATION

The HDAS devices accept either 8 single-ended or 4 differential input signals. Tie unused channels to SIGNAL GROUND, pin 14.

Channel selection is accomplished using the multiplexer address pins shown in Table 1. Obtain additional channels by connecting external multiplexers.

The acquisition time is the amount of time the multiplexer, instrumentation amplifier and sample-hold require to settle within a specified range of accuracy. The acquisition time can be measured by how long EOC is low before the rising edge of the START CONVERT pulse for continuous operation. Higher gains require the use of the RGAIN resistor to increase the acquisition time. The gain is equal to 1 without an RGAIN resistor. Table 2 refers to the appropriate RGAIN resistors for various throughputs.

The HDAS devices enter the hold mode and are ready for conversion upon the start convert going high. The conversion is complete within a maximum of 800 nsec (+25°C). EOC returns low, the data is valid and sent to the three-state output buffers. The sample/hold is now ready to acquire new data.

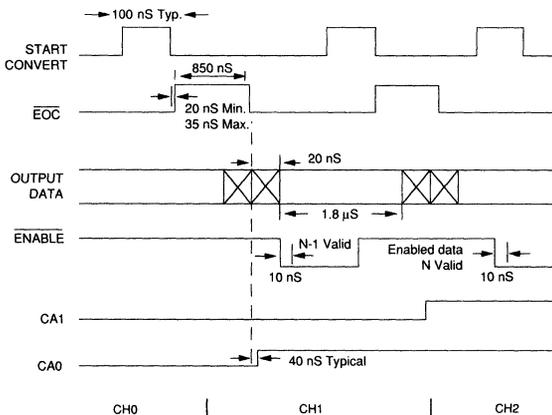

Figure 1. HDAS-524/528 Timing Diagram

NOTES:

1. A START CONVERT pulse greater than 150 nS will slow the throughput.
2. Retriggering START CONVERT before EOC goes low will not start a new conversion.
3. Times shown apply over the full operating temperature range.

Note 1.  $R_{gain} = \frac{1}{(gain - 1)}$

$$R_{gain} = \frac{1}{(gain - 1)}$$

2K

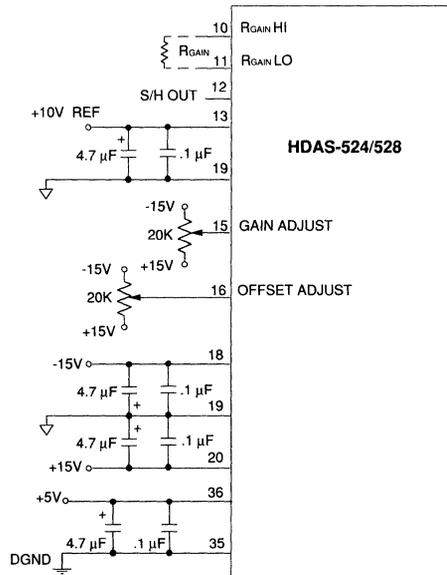

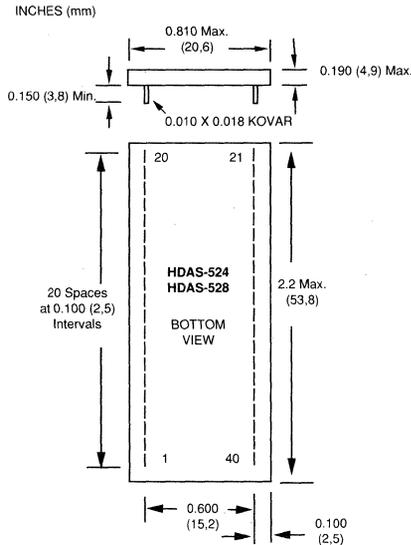

Figure 2. Typical Connection Diagram

NOTES:

1. For unipolar operation, connect pin 12 to pin 17.
2. For bipolar operation, connect pin 13 to pin 17.
3. Position RGAIN as close as possible to pins 10 and 11. Use RN55C, 1% resistors.
4. If gain and offset adjusts are not used connect pin 15 to ground and leave pin 16 open.

## MECHANICAL DIMENSIONS

## CALIBRATION PROCEDURE

1. Connect the converter per Figure 2 and Tables 2 and 3 for the appropriate full-scale range (FSR). Apply a pulse of 100 nanoseconds (typical) to the START CONVERT input (pin 40) at a rate of 100 KHZ. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

### 2. Zero Adjustments

Apply a precision voltage reference source between the analog input and signal ground (pin 14). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with the COMP BIN (pin 9) tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with the COMP BIN (pin 9) tied low (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with COMP BIN (pin 9) tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with COMP BIN (pin 9) tied low (complementary offset binary).

### 3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 or 0000 0000 0001 and 0000 0000 0000 for complementary coding.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

## ORDERING INFORMATION

| MODEL NUMBER | INPUT         | OPERATING<br>TEMP. RANGE | SEAL     |
|--------------|---------------|--------------------------|----------|
| HDAS-524MC   | 4 D CHANNELS  | 0 to +70 °C              | Hermetic |
| HDAS-524MM   | 4 D CHANNELS  | -55 to +125 °C           | Hermetic |
| HDAS-528MC   | 8 SE CHANNELS | 0 to +70 °C              | Hermetic |
| HDAS-528MM   | 8 SE CHANNELS | -55 to +125 °C           | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

For availability of MIL-STD-883B versions of the HDAS-524 & HDAS-528, contact DATEL.

#### FEATURES

- 12-bit resolution, 250 KHz
- 8 channels single-ended or 4 channels differential
- Miniature 40-pin DDIP
- Full scale gain range from 100 mV to 10V
- Three-state outputs
- No missing codes

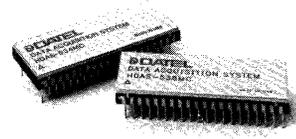

#### GENERAL DESCRIPTION

The HDAS-534/538 are complete data acquisition systems containing an internal multiplexer, instrumentation amplifier, sample-and-hold, analog-to-digital converter and three-state outputs. Packaged in a miniature 40-pin double-dip package, the HDAS-534/538 provides 250 KHz throughput with a low power dissipation of 2.6 Watts.

The HDAS-534 provides 4 differential inputs and the HDAS-538 provides 8 single-ended inputs. An internal instrumentation amplifier is characterized for gains of 1,2,4,8,10 and 100. The gain range is selectable through an external resistor.

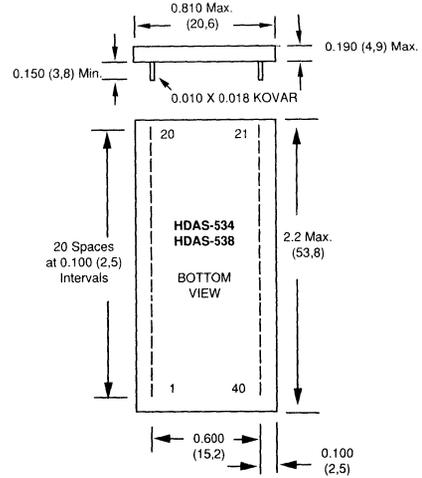

#### TECHNICAL NOTES

1. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the analog, signal and digital grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.
2. Double-level multiplexing allows expanding the multiplexer channel capacity of the HDAS-538 from 8 single-ended channels to 128 single-ended channels or the HDAS-534 from 4 differential channels to 32 single-ended channels.
3. Obtain straight binary/offset binary output coding by tying COMP BIN (pin 9) to +5V dc or leaving it open. The device has an internal pull-up resistor on this pin. To obtain complementary binary or complementary offset binary output coding,

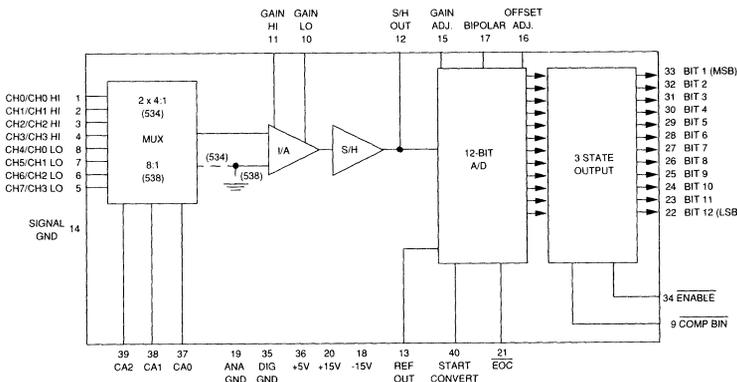

#### MECHANICAL DIMENSIONS

INCHES (mm)

tie pin 9 to ground. Pin 9 signal is compatible to CMOS/TTL logic levels for logic control of this function.

4. To enable the three-state outputs, connect  $\overline{\text{ENABLE}}$  (pin 10) to a logic "0" (low). To disable, connect pin 10 to a logic "1" (high).

## HDAS-534/538 OPERATION

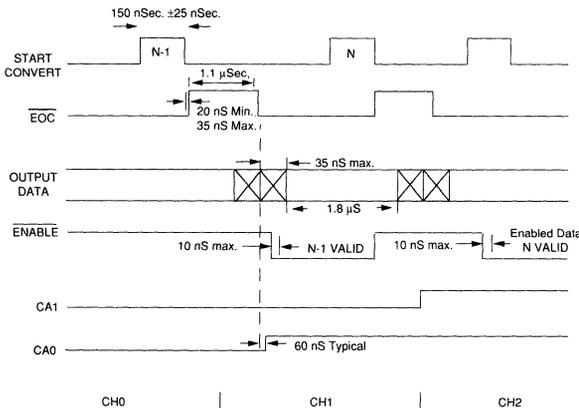

The HDAS devices accept either 8 single-ended or 4 differential input signals. Tie unused channels to SIGNAL GROUND, pin 14.

Channel selection is accomplished using the multiplexer address pins shown in Table 1. Obtain additional channels by connecting external multiplexers.

The acquisition time is the amount of time the multiplexer, instrumentation amplifier and sample-hold require to settle within a specified range of accuracy.

The acquisition time can be measured by how long  $\overline{EOC}$  is low before the rising edge of the START CONVERT pulse for continuous operation. Higher gains require the use of the RGAIN resistor to increase the acquisition time. The gain is equal to 1 without an RGAIN resistor. Table 2 refers to the appropriate RGAIN resistors for various throughputs.

The HDAS devices enter the hold mode and are ready for conversion upon the start convert going high. The conversion is complete within a maximum of 1  $\mu$ sec (+25°C).  $\overline{EOC}$  returns low, the data is valid and sent to the three-state output buffers. The sample/hold is now ready to acquire new data.

$$\frac{1}{\frac{(\text{gain} - 1)}{2K}}$$

**Notes**

1. A START CONVERT pulse greater than 175 nanoseconds will slow the throughput.
2. Retriggering START CONVERT before  $\overline{EOC}$  goes low will not start a new conversion.
3. Times shown apply over the full operating temperature range.

**Table 3. Zero and Gain Adjust**

| FSR                          | Zero Adjust<br>+1/2 LSB | Gain Adjust<br>+FS - 1 1/2 LSB |
|------------------------------|-------------------------|--------------------------------|
| 0 to +10V dc<br>$\pm 10V$ dc | +1.22mV<br>+2.44 mV dc  | +9.9963V dc<br>+9.9927V dc     |

## CALIBRATION PROCEDURE

1. Connect the converter per Figure 2 and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 150 nSec (typical) to the START CONVERT input (pin 40) at a rate of 75 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

### 2. Zero Adjustments

Apply a precision voltage reference source between the analog input and signal ground (pin 14). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001 with COMP BIN (pin 9) tied high (straight binary) or between 1111 1111 1111 and 1111 1111 1110 with pin 9 tied low (complementary binary).

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001 with pin 9 tied high (offset binary) or between 0111 1111 1111 and 0111 1111 1110 with pin 9 tied low (complementary offset binary).

### 3. Full-Scale Adjustment

Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111 for pin 9 tied high and 0000 0000 0001 and 0000 0000 0000 for pin 9 tied low.

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

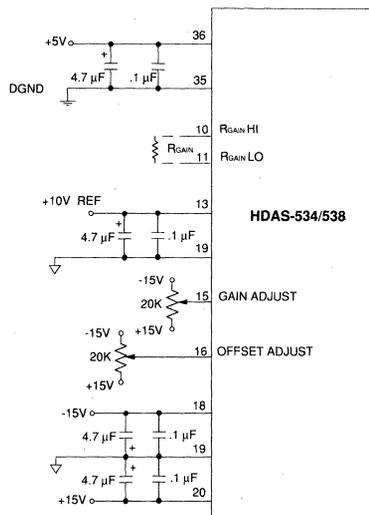

Figure 2. Typical Connection Diagram

### NOTES:

1. For unipolar operation, connect pin 12 to pin 17.
2. For bipolar operation, connect pin 13 to pin 17.
3. Position  $R_{GAIN}$  as close as possible to pins 10 and 11. Use RN55C, 1% resistors.
4. If gain and offset adjusts are not used connect pin 15 to ground and leave pin 16 open.

### ORDERING INFORMATION

| MODEL NO.  | INPUT         | OPER. TEMP. RANGE | SEAL     |
|------------|---------------|-------------------|----------|
| HDAS-534MC | 4 D Channels  | 0 to +70 °C       | Hermetic |
| HDAS-534MM | 4 D Channels  | -55 to +125°C     | Hermetic |
| HDAS-538MC | 8 SE Channels | 0 to +70° C       | Hermetic |
| HDAS-538MM | 8 SE Channels | -55 to +125 °C    | Hermetic |

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

For availability of MIL-STD-883B versions, contact DATEL.

#### FEATURES

- 12-Bit resolution, 75 KHz
- 8 Channels single-ended or 4 channels differential
- Miniature 40-pin DDIP
- Full-scale gain range from 100 mV to 10V
- High impedance output state
- No missing codes

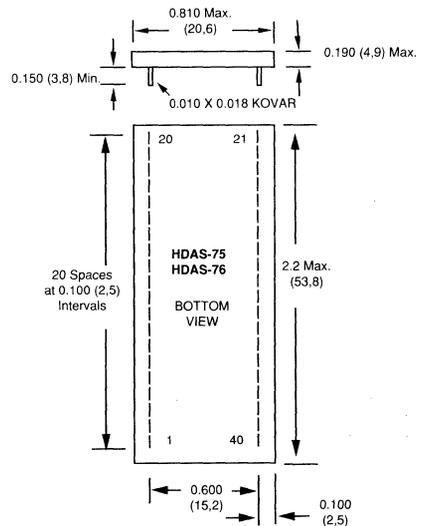

#### GENERAL DESCRIPTION

The HDAS-75,-76 are complete data acquisition systems containing an internal multiplexer, instrumentation amplifier, sample-hold, analog-to-digital converter and three-state outputs. Packaged in a miniature 40-pin double-dip package, the HDAS-75/76 has a low power dissipation of 500 milliwatts.

The HDAS-76 provides 4 differential inputs and the HDAS-75 provides 8 single-ended inputs. An internal instrumentation amplifier is characterized for gains of 1,2,4,8,10 and 100. The gain range is selectable through an external resistor.

#### MECHANICAL DIMENSIONS

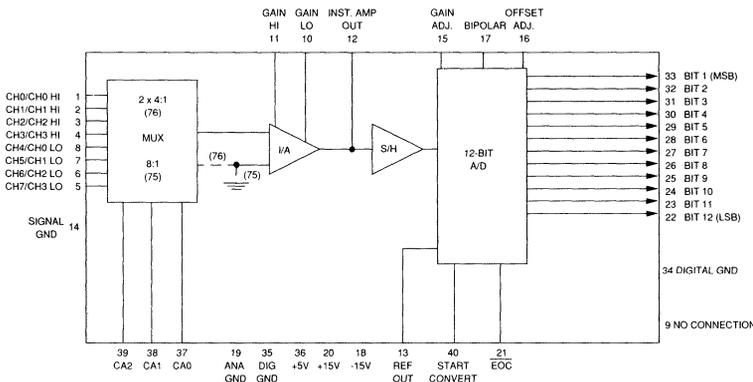

##### INCHES (MM)

#### TECHNICAL NOTES

1. Rated performance requires using good high-frequency circuit board layout techniques. The analog and digital grounds are not connected internally. Avoid ground-related problems by connecting the analog, signal and digital grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.

2. Double-level multiplexing allows expanding the multiplexer channel capacity of the HDAS-75 from 8 single-ended channels to 128 single-ended channels or the HDAS-76 from 4 differential channels to 32 single-ended channels.

**HDAS-75/76 OPERATION**

The HDAS devices accept either 8 single-ended or 4 differential input signals. Tie unused channels to SIGNAL GROUND, pin 14.

Channel selection is accomplished using the multiplexer address pins shown in Table 1. Obtain additional channels by connecting external multiplexers.

The acquisition time is the amount of time the multiplexer, instrumentation amplifier and sample-hold require to settle within a specified range of accuracy after the start convert goes high.

The acquisition time can be measured by how long EOC is low before the rising edge of the START CONVERT pulse for continuous operation. Higher gains require the use of the RGAIN resistor to increase the acquisition time. The gain is equal to 1 without an RGAIN resistor. Table 2 refers to the appropriate RGAIN resistors for various throughputs.

**Table 2. Input Range Parameters**

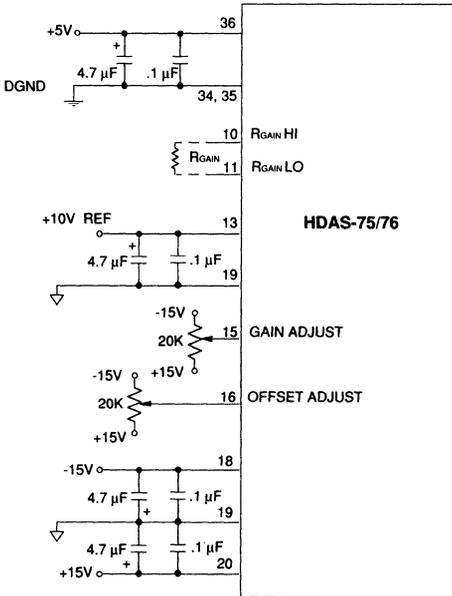

| INPUT RANGE | GAIN | RGAIN | THROUGHPUT |
|-------------|------|-------|------------|
| 0 to +10V   | 1    | OPEN  | 75 KHz     |
| 0 to +5V    | 2    | 2K Ω  | 60 KHz     |
| 0 to +2.5V  | 4    | 665 Ω | 50 KHz     |
| 0 to +1.25V | 8    | 287 Ω | 45 KHz     |
| 0 to +1.0V  | 10   | 221 Ω | 40 KHz     |
| 0 to +100mV | 100  | 20 Ω  | 10 KHz     |
| ±10V        | 1    | OPEN  | 75 KHz     |

| 1                | 1         | 1         | 7       |

**Figure 2. Typical Connection Diagram**

**NOTES:**

1. For unipolar operation, connect pin 12 to pin 17.
2. For bipolar operation, connect pin 13 to pin 17.
3. Ground pin 15 if Gain Adjust is not used.
4. Leave pin 16 open if offset adjust is not used.
5. Position RGAIN as close as possible to pins 10 and 11. Use RN55C, 1% resistors.

**CALIBRATION PROCEDURE**

1. Connect the converter per Figure 2 and Tables 2 and 3 for the appropriate full-scale range (FSR). Apply a pulse of 1.0 μsec (typical) to the START CONVERT input (pin 40) at a rate of 75 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

**2. Zero Adjustments**

Apply a precision voltage reference source between the analog input and signal ground (pin 14). Adjust the output of the reference source per Table 3. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 and 0000 0000 0001.

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 and 1000 0000 0001.

**3. Full-Scale Adjustment**

Set the output of the voltage reference used in step 2 to the value shown in Table 3. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1110 and 1111 1111 1111.

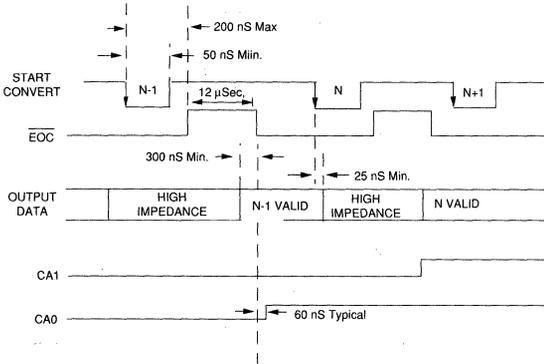

4. To confirm proper operation of the device, vary the precision reference voltage source to obtain the output coding listed in Table 4.

**Table 3. Zero and Gain Adjust**

| FSR          | Zero Adjust<br>+1/2 LSB | Gain Adjust<br>+FS - 1 1/2 LSB |
|--------------|-------------------------|--------------------------------|
| 0 to +10V dc | +1.22mV                 | +9.9963V dc                    |
| ±10V dc      | +2.44 mV dc             | +9.9927V dc                    |

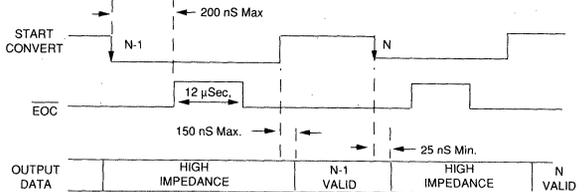

## TIMING

The  $\overline{EOC}$  output signal, when high, indicates that a conversion is in process. During a conversion the digital output buffers are in a high impedance state, preventing data from being read. A START CONVERT input received during a conversion has no effect on the existing conversion. As shown in Figure 1a, data can be read while START CONVERT is high and  $\overline{EOC}$  is low.

**Figure 1a. Data Valid with START CONVERT Immediately Returned High**

The A/D conversion begins on the falling edge of a start convert command. If START CONVERT stays low after  $\overline{EOC}$  becomes low, the output buffers stay in a high impedance state. Valid data can be read 150 nanoseconds maximum after START CONVERT goes high. Figure 1b shows how to use the START CONVERT pulse to control when the output data becomes valid.

**Figure 1b. Data Valid with START CONVERT Returned High Later**

### NOTES:

1. A START CONVERT pulse greater than 5  $\mu$ s will slow the overall throughput.
2. Retriggerring START CONVERT before  $\overline{EOC}$  goes low will not initiate a new conversion.
3. Timing specifications apply over the full operating temperature range.

Receptacle for PC board mounting can be ordered through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 40 required.

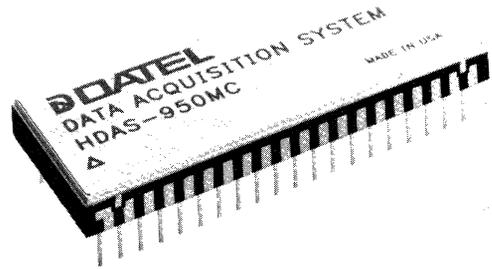

### FEATURES

- 16-Bit resolution, 100 KHz
- 8 Channels single-ended or 4 channels differential
- Miniature 40-pin DDIP
- Full-scale gain range from 100 mV to 10V
- High-impedance output state

### GENERAL DESCRIPTION

The HDAS-950/-951 are complete data acquisition systems containing an internal multiplexer, instrumentation amplifier, sample-hold, analog-to-digital converter and three-state outputs. Packaged in a miniature 40-pin double-dip package, the HDAS-950/-951 have a low power dissipation of 2.4 watts.

The HDAS-951 provides 4 differential inputs and the HDAS-950 provides 8 single-ended inputs. An internal instrumentation amplifier is characterized for gains of 1, 2, 4, 8, 10 and 100. the gain range is selectable using an external resistor.

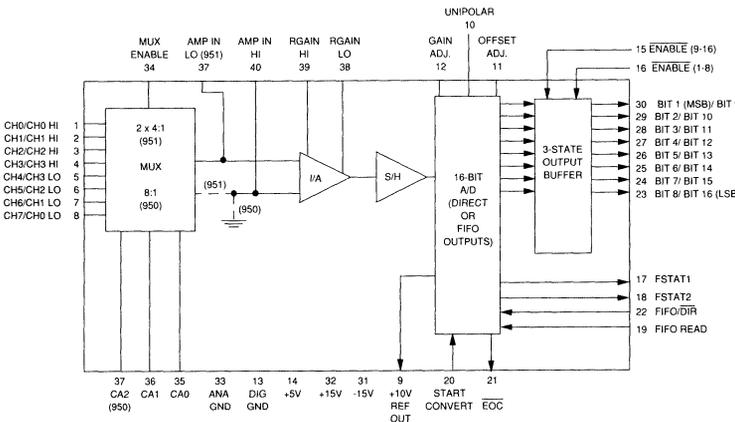

### TECHNICAL NOTES

1. Use external potentiometers to remove system errors or the small initial errors to zero. Use a 20K trimming potentiometer for gain adjustment with the wiper tied to pin 12 (ground pin 12 for operation without adjustments). Use a 20K trimming potentiometer with the wiper tied to pin 11 for zero/offset adjustment (leave pin 11 open for operation without adjustment).
2. Bypass the analog and digital supplies and the +10V reference (pin 9) to ground with a 4.7  $\mu$ F, 25V tantalum electrolytic capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor. Bypass the +10V reference (pin 9) to analog ground (pin 33).
3. Rated performance requires using good high-frequency circuit board layout techniques. the analog and digital grounds

are not connected internally. Avoid ground-related problems by connecting the analog and digital grounds to one point, the ground plane beneath the converter. Due to the inductance and resistance of the power supply return paths, return the analog and digital ground separately to the power supplies.

4. Double-level multiplexing allows expanding the multiplexer channel capacity of the HDAS-950 from 8 single-ended channels to 128 single-ended channels or the HDAS-951 from 4 differential channels to 32 single-ended channels.

### NOTES:

① Specifications valid at 25 °C and over the operating temperature ranges of 0 to +70 °C and -55 to +125 °C.

② Pulse widths greater than 5 μSec. will decrease the specified throughput rate.

**HDAS-950/951 OPERATION**

The HDAS devices accept either 8 single-ended or 4 differential input signals. Tie unused channels to ANALOG GROUND, pin 33.

Channel selection is accomplished using the multiplexer address pins shown in Table 1. Obtain additional channels by connecting external multiplexers.

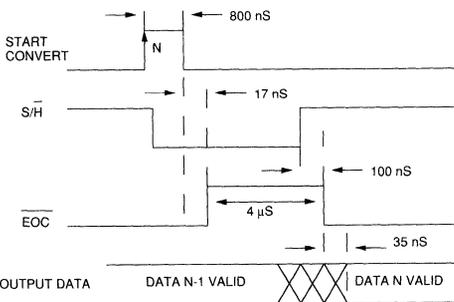

The acquisition time is the amount of time the multiplexer, instrumentation amplifier and sample-and-hold require to settle within a specified range of accuracy prior to EOC going low. The acquisition time can be measured by how long EOC is low before the rising edge of the START CONVERT pulse for continuous operation. Higher gains require the use of the RGAIN resistor to increase the acquisition time. The gain is equal to 1 without an RGAIN resistor. Table 2 refers to the appropriate RGAIN resistors for various throughputs.

**Table 2. Input Range Parameters**

| INPUT RANGE | GAIN | RGAIN | THROUGHPUT |
|-------------|------|-------|------------|
| 0 to +10V   | 1    | OPEN  | 100 KHz    |
| 0 to +5V    | 2    | 2K Ω  | 75 KHz     |
| 0 to +2.5V  | 4    | 665 Ω | 75 KHz     |
| 0 to +1.25V | 8    | 287 Ω | 75 KHz     |
| 0 to +1.0V  | 10   | 221 Ω | 75 KHz     |
| 0 to +100mV | 100  | 20 Ω  | 50 KHz     |
| ±5V         | 1    | OPEN  | 100 KHz    |
| ±2.5V       | 2    | 2K Ω  | 75 KHz     |
| ±1.25V      | 4    | 665 Ω | 75 KHz     |
| ±0.625V     | 8    | 287 Ω | 75 KHz     |
| ±0.5V       | 10   | 221 Ω | 75 KHz     |
| ±50mV       | 100  | 20 Ω  | 50 KHz     |

**Note** Rgain = 2K/(gain - 1)

The HDAS devices enter the hold mode and are ready for conversion upon the start convert going high; the falling edge forces EOC high. the conversion is complete within a maximum of 4 μsec (+25 °C). EOC returns low, the data is valid and sent to the output. The sample/hold is now ready to acquire new data. The next start convert pulse repeats the process for the next conversion.

**Figure 1. HDAS-950/951 Timing**

The specifications listed in Figure 1 apply over the full operating temperature range unless otherwise specified.

|           | FSTAT1 | FSTAT2 |
|-----------|--------|--------|
| Empty     | 0      | 1      |
| Half-full | 1      | 0      |
| Full      | 1      | 1      |

**Table 5. FIFO Status**

**FIFO OPERATION**

**FIFO/DIR** When HIGH, the FIFO is enabled. When LOW, the data is brought directly to the output bits.

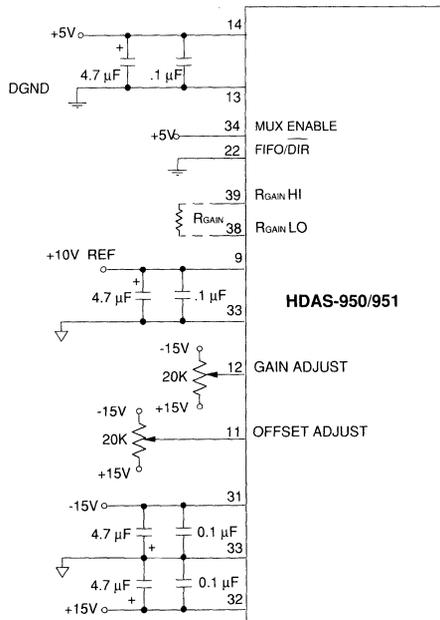

**FIFO READ** A rising pulse edge brings the oldest (First In) word stored in the memory to the output bits.

**FSTAT1, FSTAT2** These outputs show the status of the FIFO. See Table 5.

**Table 1. MUX Channel Addressing**

| MUX ADDRESS PINS | CHANNEL |        |   |

HDAS-951 (2-BIT ADDRESS)  
HDAS-950 (3-BIT ADDRESS)

**Figure 2. Typical Connection Diagram**

**NOTES:**

- For unipolar operation, connect pin 9 to pin 10.
- For bipolar operation, leave pin 10 floating.
- Position Rgain as close as possible to pins. Use RN55C, 1% resistors.

## CALIBRATION PROCEDURE

1. Connect the converter per Figure 2 and Table 2 for the appropriate full-scale range (FSR). Apply a pulse of 1.0  $\mu$ sec (typical) to the START CONVERT input (pin 20) at a rate of 50 KHz. This rate is chosen to reduce flicker if LED's are used on the outputs for calibration purposes.

### 2. Zero Adjustments

Apply a precision voltage reference source between the analog input and analog ground (pin 33). Adjust the output of the reference source per Table 3 for the unipolar zero or the bipolar zero adjustment. For unipolar, adjust the zero trimming potentiometer so that the output code flickers equally between 0000 0000 0000 0000 and 0000 0000 0000 0001.

For bipolar operation, adjust the potentiometer such that the code flickers equally between 1000 0000 0000 0000 and 1000 0000 0000 0001.

### 3. Full-Scale Adjustment

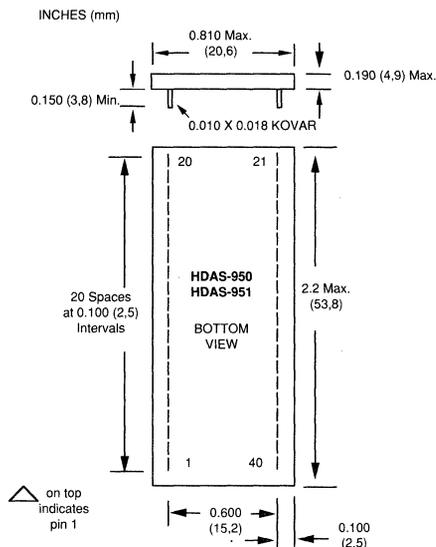

Set the output of the voltage reference used in step 2 to the value shown in Table 3 or for the unipolar or bipolar gain adjustment. Adjust the gain trimming potentiometer so that the output code flickers equally between 1111 1111 1111 1110 and 1111 1111 1111 1111.

4. To confirm proper operation of the device, vary the precision reference voltage to obtain the output coding listed in Table 4.

## NOTES

1. This procedure is valid for single-ended inputs only.
2. External circuitry is needed to alternately enable both bytes.

### FEATURES

- 0.01% Accuracy
- Low "ON" resistance
- Break-before-make switching
- Dielectrically isolated CMOS
- Single-ended or differential
- Fast settling time
- DTL/TTL/CMOS-compatible
- 350 KHz Sampling rate

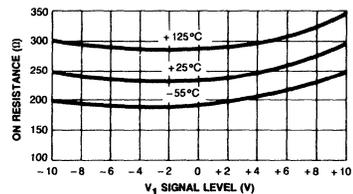

### GENERAL DESCRIPTION

The MV Series analog multiplexers are 4-, 8-, and 16-channel monolithic devices featuring a low ON resistance of 270 ohms. These units are manufactured with CMOS technology using a dielectric isolation process. There are 8- and 16-channel single-ended models and 4- and 8-channel differential models in this series. Channel addressing is done by a 2-, 3-, or 4-bit binary code; an inhibit input enables or disables the entire device to permit expansion of the number of channels by using several devices together. Another important feature is break-before-make switching, which insures that no two channels are ever momentarily shorted together. With a high impedance load, transfer accuracies of 0.01% can be achieved at channel sampling rates up to 350 KHz.

### MECHANICAL DIMENSIONS INCHES (MM)

### ON RESISTANCE VS. TEMPERATURE

### Footnotes

- For MV-1606M typical value is 170 ohms.
- For MV-1606M maximum value is 400 ohms.
- Channel address and inhibit inputs.
- For MV-808 and MVD-409; to drive from DTL/TTL logic 1K pull-up resistors to +5V should be used.
- For MV-1606M maximum current is +3, -1 mA.

## TECHNICAL NOTES

- The transfer accuracy of the MV series multiplexers depends on both the source resistance and load resistance. For example, with zero source resistance and assuming 500 ohms maximum channel ON resistance, the load impedance must be at least 5 megohms to achieve 0.01% accuracy. In practice it is recommended that a load impedance of 10<sup>8</sup> ohms or more be used. Source resistance should be kept as low as possible so that accuracy or settling time are not degraded. Less than 250 ohms is recommended.
- Channel expansion is accomplished by use of the inhibit input of the multiplexers. To expand the number of channels, use multiple multiplexers with the inhibit inputs connected to a decoder.

### FEATURES

- 200 KHz Sampling rates
- 0.01% Accuracy
- Dielectrically isolated CMOS
- Break-before-make switching
- Single-ended and differential
- Overvoltage protection
- DTL/TTL/CMOS-compatible
- 7.5 mW Standby power

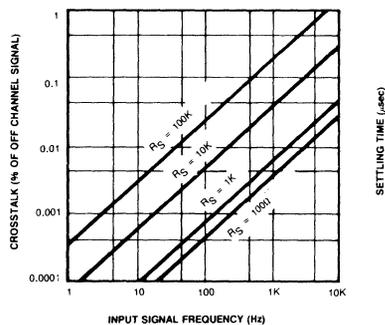

### GENERAL DESCRIPTION

The MX Series analog multiplexers are 4-, 8-, and 16-channel monolithic devices manufactured with a dielectrically isolated complementary MOS process. The circuits incorporate analog and digital input protection which protects the units from both overvoltage and loss of power. The digital inputs are DTL/TTL/CMOS compatible and address the proper channel by means of a 2-, 3-, or 4-bit binary code. An inhibit input enables or disables the entire device and this permits expansion of the number of channels by using several devices together. Another important feature of these multiplexers is the use of break-before-make switching to insure that no two channels are ever momentarily shorted together. Transfer accuracies of 0.01% can be achieved at channel sampling rates up to 200 KHz and over  $\pm 10V$  signal ranges.

### Footnotes

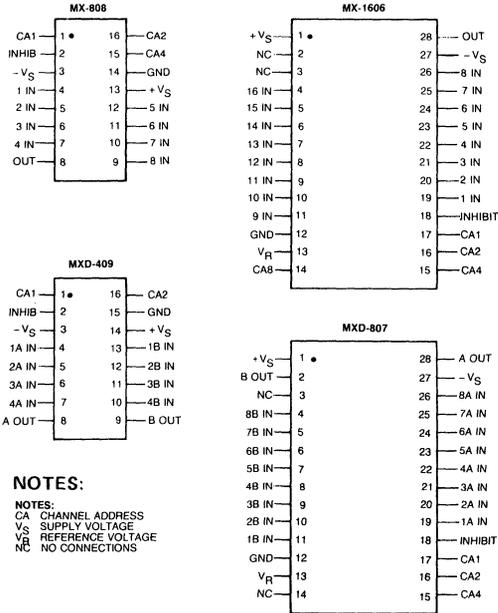

- The digital inputs are the channel address inputs and the inhibit input.
- To drive from DTL/TTL circuits, 1K pull-resistors to +5V are recommended. With models MX-1606 and MXD-807, pin 13 should be left open.
- For a +6.0V threshold with models MX-1606 and MXD-807, pin 13 is connected to +10V.
- With a load impedance of >100 megohms in parallel with 2 pF.

## TECHNICAL NOTES

- The transfer accuracy of these multiplexers depends on both the source resistance and the load resistance. With zero source resistance, and assuming 2K ohms maximum channel ON resistance, the load impedance should be at least 20 megohms to achieve 0.01% accuracy. In practice, it is recommended that a load impedance of at least 100 megohms be used to minimize errors. Source resistance should be kept as low as possible so that accuracy is not affected; less than 1 K ohms is recommended. Higher source resistance, in addition to affecting accuracy, will degrade the settling time of the multiplexer.
- Channel expansion uses the inhibit input of the multiplexer. A logic 0 on this input disables the multiplexer.

### FEATURES

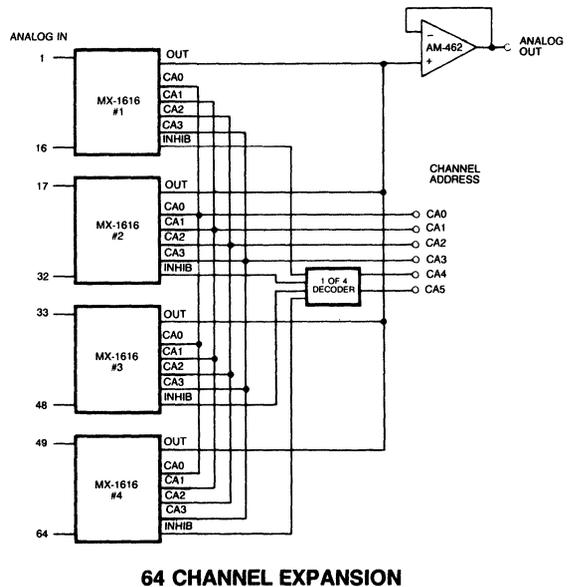

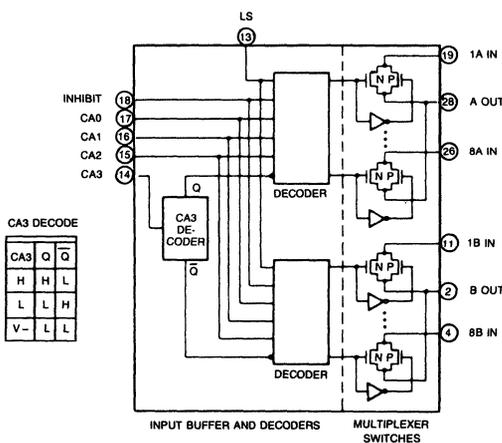

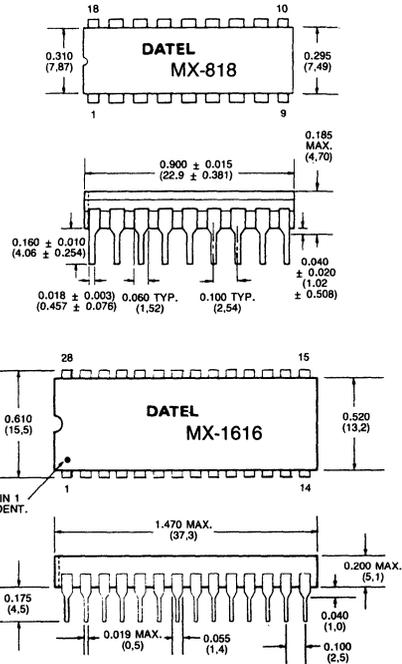

- 800 Nanoseconds settling time
- Programmable input mode
- Break-before-make switching
- Dielectrically isolated CMOS
- TTL/CMOS-compatible

### GENERAL DESCRIPTION

The MX-1616 and MX-818 are high-speed high performance analog multiplexers manufactured with a dielectrically isolated CMOS process. Both devices achieve transfer accuracies of 0.01% at channel sampling rates of up to 1.25 MHz over  $\pm 10V$  signal ranges. These multiplexers are ideal for high-speed, multichannel, data acquisition systems where the multiplexer operates into a high impedance load such as a sample-hold, buffer amplifier or instrumentation amplifier.

A unique feature of these circuits is the ability of the use to program their inputs for either single-ended or differential operation. The MX-1616 is user programmable either as a single-ended 16-channel or as a differential 8-channel multiplexer while the MX-818 is user programmable either as a single-ended 8-channel or as a differential 4-channel multiplexer.

| Power Dissipation, maximum | 900 mW      | 540 mW      |

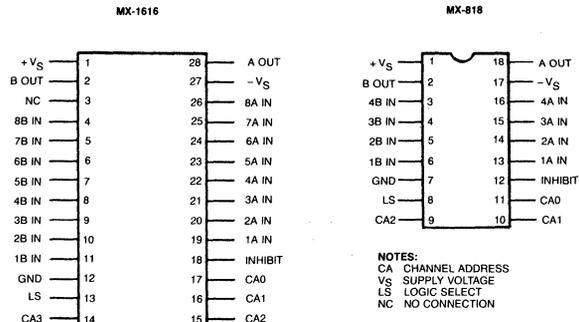

## FOOTNOTES:

- For TTL compatibility, the Logic Select pin (MX-1616 Pin 13, MX-818 Pin 8) is grounded or left open.
- For CMOS compatibility, the Logic Select Pin (MX-1616 Pin 13, MX-818 Pin 8) is tied to the system Logic Supply.
- V<sub>in</sub> = ±10V, I<sub>out</sub> = -100 μA.
- 200 nseconds maximum at full rated operating temperature.
- 150 nseconds maximum at full rated operating temperature.

## TECHNICAL NOTES

- The transfer accuracy of the MX-1616 and MX-818 depends upon both the source and the load resistance. With zero source resistance and assuming 1 KΩ maximum channel on resistance the load impedance must be at least 10 MΩ to achieve 0.01% accuracy. Source resistance should be kept as low as possible so that accuracy or settling time are not degraded. Less than 500Ω is recommended.
- Channel expansion is accomplished by the use of the inhibit input of the multiplexers. To expand the number of channels, use multiple multiplexers with the inhibit inputs connected to a decoder.

### FEATURES

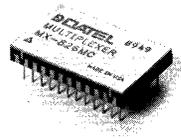

- 225 nSec. maximum settling time to 0.01%
- 400 nSec. maximum settling time to 0.003%
- 150 nSec. maximum settling time to 0.1%
- 8 Channels single-ended inputs
- 395 mW Power dissipation
- Small 24-pin DDIP package

### GENERAL DESCRIPTION

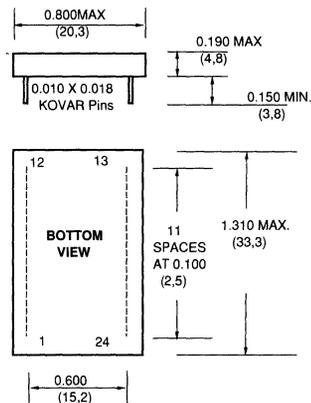

The MX-826 is a precision high-speed multiplexer characterized for 10-, 12-, and 14-bit applications. The performance benchmarks are its 225 nanoseconds maximum settling time to 0.01% accuracy and its unprecedented specification of accuracy to 0.003%.

The MX-826 provides eight single-ended inputs. Channel addressing is done by a three-bit binary code. Break-before-make switching assures that no two channels are ever momentarily shorted together.

The MX-826 operates from  $\pm 15V$  and  $+5V$  power supplies. Models are available in two operating temperature ranges: 0 to  $+70^\circ C$  and  $-55$  to  $+125^\circ C$ .

### MECHANICAL DIMENSIONS INCHES (mm)

NOTE: Pins have a 0.025 inch,  $\pm 0.01$  stand-off from case.

**TECHNICAL NOTES**

1. Bypass the ±15V and +5V power supplies with a 1 µF, 25V tantalum electrolytic capacitor in parallel with a 0.1 µF ceramic capacitor.
2. Analog signals up to ±15V may be present while the MUX power supplies are off.
3. The absence of an R<sub>ON</sub> specification or output leakage specification is related to the architecture of the switching network. The inputs see a constant 2.5 K Ohm input impedance whether the channel is on or off.
4. Typical recovery times from an overvoltage condition of >±3V is approximately 200 nanoseconds from a negative overdrive and 700 nanoseconds from a positive overdrive.
5. Double level multiplexing may be used to provide up to 64 channels (nine MX-826's required).

**Table 1. Channel Addressing**

| On Channel | MUX Address |    |    |
|------------|-------------|----|----|
|            | A2          | A1 | A0 |
| 1          | 0           | 0  | 0  |

MX-826MC       8SE           0 to +70 °C  
 MX-826MM       8SE           -55 to +125 °C

Order PC board mounting receptacle through AMP Inc., Part # 3-331272-8 (Component Lead Socket), 24 required.

For availability of MIL-STD-883B version contact DATEL.

### FEATURES

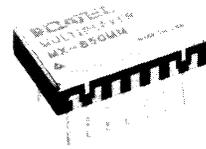

- 50 nSec settling time to 0.01%
- 70 nSec settling time to 0.003%
- 100 nSec settling time to 0.001%
- 4 Channels, single-ended inputs
- 207 mW power dissipation
- Small 14-pin DIP package

### GENERAL DESCRIPTION

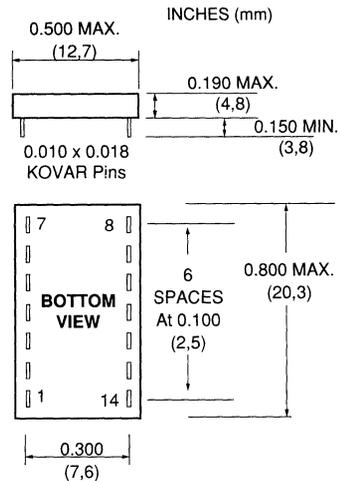

The MX-850 is a precision high-speed multiplexer characterized for 10-, 12-, 14-, and 16-bit applications. The performance benchmarks are its 50 nanosecond maximum settling time to 0.01% accuracy and its unprecedented specification of accuracy to 0.001%.

### TECHNICAL NOTES

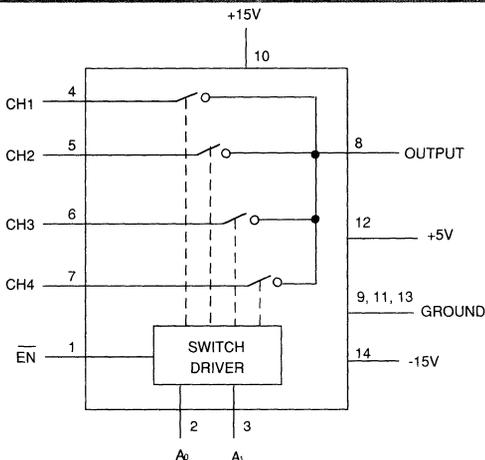

1. Proper operation of the MX-850 multiplexer is dependent upon good board layout and connection practices. Bypass supplies as shown in the connection diagrams. Mount bypass capacitors directly to the supply pins whenever possible.
2. All grounds pins (9, 11, 13) should be tied together and connected to ground as close to the multiplexer as possible.
3. When power is off, current limit input signals on pins 4, 5, 6, and 7 to 20 mA. Failure to current limit will cause permanent damage to the device, as when powering up or down, it is possible that two switches might be on at the same time. Excessive current (greater than 20 mA) will flow from the more positive input to the more negative input, permanently damaging the device. Applications where the power supply for the multiplexer also powers the signal sources may not require limiting resistors. See Figure 4.

### MX-850 Mechanical Dimensions

NOTE: Pins have 0.025 Inch  $\pm 0.01$  stand-off from case.

MX-850 Simplified Block Diagram

| PIN | FUNCTION   |
|-----|------------|
| 1   | ENABLE     |
| 2   | A0         |
| 3   | A1         |
| 4   | CH 1 INPUT |

**Current Limiting Resistors**

As noted in Technical Note 3, some current limiting technique must be employed to protect the device. The following lists the suggested resistor values for the current limiting resistors shown in Figure 4.

| Input Ranges | Limiting Resistors      |
|--------------|-------------------------|
| ±10V         | R=500Ω                  |
| ±5V          | R=250Ω                  |
| ≤±1V         | No current limit needed |

Other current limiting circuits can be used, such as a current limited op amp drive, depending upon the application.

**Figure 4. Typical Connections**

**Figure 5. Cascading Multiple MX-850's**

**Channel Expansion**

The MX-850's ENABLE input provides a means of channel expansion. As shown in Figure 5 and in Table 2, multiple multiplexers may be used by connecting the ENABLE inputs to a decoder.

# AM-1435

## Ultra-High Speed Wideband Operational Amplifier

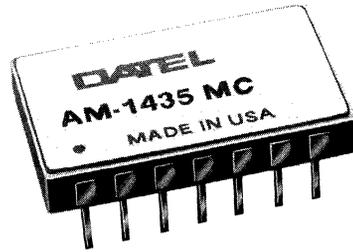

### FEATURES

- 70 Nanoseconds settling to 0.01%
- 1 GHz Gain bandwidth product
- 100 dB Open loop gain
- 80 dB Minimum CMRR
- -55°C to +125°C Operation

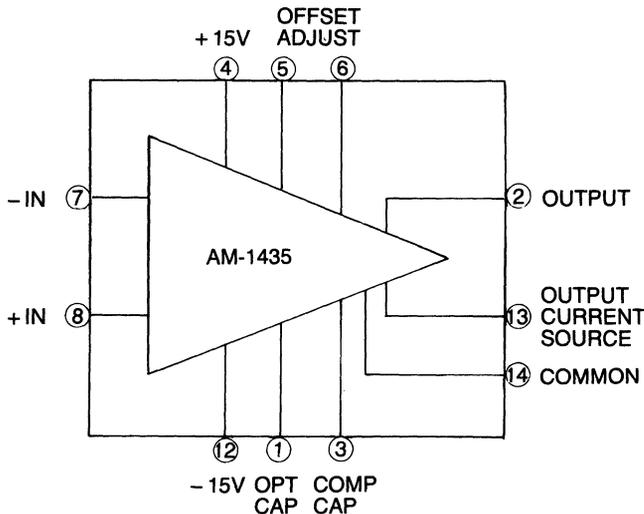

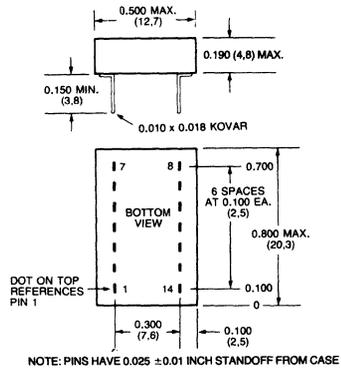

### GENERAL DESCRIPTION

DATEL's AM-1435 is an ultrafast settling, wide-band operational amplifier. Utilizing precision thin-film hybrid construction and differential input operational amplifier design techniques, the AM-1435 achieves a settling time of only 70 nanoseconds for a 10 volt step to 0.01% accuracy. High speed performance is optimized with high open-loop gain, flat frequency response beyond 10 KHz and a roll-off of 6 dB/octave to beyond 100 MHz. Typically, gain bandwidth product is 1 GHz and slew rate is 300 V/microsecond.

AM-1435 dc characteristics include a dc open loop gain of 100 db, 1 MΩ input impedance, and an initial input offset voltage of only ±2 mV. Input offset voltage drift is typically ±5 μV/°C. Also featured is a minimum common mode rejection ratio of 80 dB and full power frequency of 8 MHz.

| Storage Temp. Range           | -65 to +125 °C                         |
| Package                       | 14-pin hermetically sealed ceramic DIP |

### FOOTNOTES:

- Specified for dc linear operation. Common mode voltage range prior to fault condition is ±10V dc maximum.
- Adjustable to zero.
- R<sub>1</sub> = 500Ω.
- C<sub>1</sub> = 3 pF.
- Referred to input.
- C<sub>1</sub> = 0.5 pF.
- C<sub>1</sub> = 1 pF.
- ±V<sub>S</sub> = ±15V dc.
- With 18°C/watt heat sink.

## TECHNICAL NOTES

- The extensive use of a ground plane for all common connections is recommended. Keep lead length to a minimum with point-to-point connections wired directly to the amplifier pins. Use 1 μF tantalum bypass capacitors the +Vs and -Vs pins.
- When using the AM-1435MM over the +85 to +125°C temperature range, use an 18°C/W heat sink.
- Apply negative supply voltage before the positive supply. Power-up prior to applying power to either input. If frequency response is not critical, use an external input protection circuit.

**COMPENSATION** - The typical connection diagram shows the AM-1435 in a unity gain inverting configuration. Use in any conventional amp circuit, the AM-1435, as a noninverting amplifier, requires a noise gain of at least two (NOISE GAIN = 1 + R<sub>4</sub>/R<sub>1</sub>).

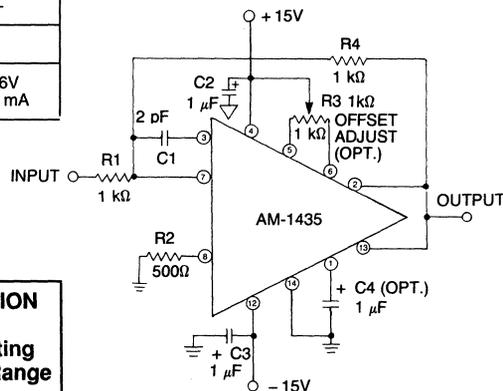

The 2 pF compensation capacitor at C<sub>1</sub> is required for stable operation when the noise gain is less than 10. Compensation for bias current is provided by R<sub>2</sub> and its value determined by the formula

$$R_2 = \frac{(R_1) \times (R_4)}{R_1 + R_4}$$

R<sub>3</sub> and C<sub>4</sub> are optional. Use C<sub>4</sub> when driving capacitive loads to prevent oscillation of the output stage.

When using the AM-1435 at low impedances, include the feedback resistor as a part of the total output load.

## TYPICAL CONNECTION DIAGRAM

## ORDERING INFORMATION

| Model No.    | Operating Temp. Range |
|--------------|-----------------------|
| AM-1435MC    | 0 to +70 °C           |
| AM-1435MM    | -55 to +125 °C        |
| AM-1435MM-QL | -55 to +125 °C        |

## FEATURES

- 200 Nanoseconds settling to 0.01%
- 1000V/Microsecond slew rate
- 100 MHz Minimum gain-bandwidth
- $10^6$  Open loop gain
- 1 Microvolt/ $^{\circ}$ C drift
- $\pm 50$  mA Output current

## GENERAL DESCRIPTION

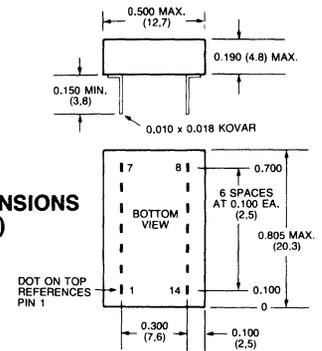

The AM-500 Series amplifiers are ultra-fast settling operational amplifiers for use in inverting applications. A unique feedforward amplifier design combines the characteristics of a low drift dc amplifier with those of a very fast AC amplifier. For optimum fast settling performance, this amplifier has an open loop gain roll-off of 6 dB per octave to beyond 100 MHz.

Output settling time is 200 nanoseconds maximum to 0.01% for a 10 dc volt step change. Slew rate is 1000V/microsecond for positive output transitions and 1800V/microsecond for negative transitions. This high slew rate permits undistorted reproduction of a full load, 20V peak-to-peak sinewave out to 16 MHz. Gain bandwidth product is 100 MHz minimum.

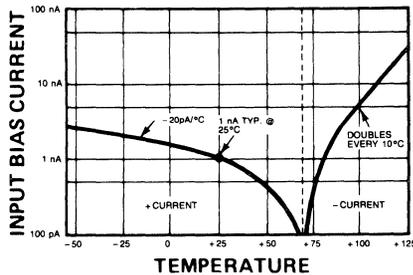

AM-500 series dc characteristics include a dc open loop gain of  $10^6$ , 30 megohm input impedance, and 1 nanoampere bias current. Input offset voltage is  $\pm 0.5$  mV and input offset voltage drift is 1 microvolt/ $^{\circ}$ C. Although these amplifiers do not operate differentially, a dc offset voltage in the range of  $\pm 5$  V dc can be applied to the positive input terminal.

Power supply requirement is  $\pm 15$  V dc at 22 mA quiescent current. The amplifiers will operate over a supply range of  $\pm 10$  V to  $\pm 18$  V dc. Output current capability is  $\pm 50$  mA with output short circuit protection.

## MECHANICAL DIMENSIONS INCHES (MM)

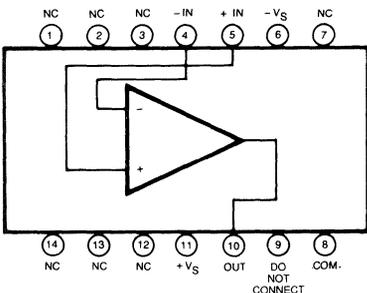

NOTE: PINS HAVE  $\pm 0.01$  INCH STANDOFF FROM CASE

## TECHNICAL NOTES

- The circuit design shows the connection of the AM-500 series for fast settling operation with a closed loop gain of -1. It can be used for fast settling at closed loop gains up to -10. The equivalent resistance seen by the summing junction should be 500 ohms or less. For gains larger than -1 use an input resistor of 500 ohms and pick a feedback resistor for the required closed loop gain (1k for -2, 1.5k for -3, etc.).
- A small feedback capacitor should be used across the feedback resistor. Determine C in nanofarads from the following formula:
 
$$C = \frac{1 + |G|}{0.816Rf}$$
 where G is closed loop gain and Rf is in kilohms.
- Summing point leads must be kept as short as possible. Input and feedback resistors should be soldered close to the body of the resistor directly to the summing point (pin 4). Summing point capacitance to ground must be kept very low.
- Low output impedance power supplies should be used with 1 μF tantalum bypassing capacitors at the amplifier supply terminals. There are internal 0.03 μF ceramic capacitors in the amplifier.
- Although these amplifiers are inverting mode only, a dc voltage in the range of ±5V may be applied to the positive input terminal for offsetting the amplifier.
- For interrupted power applications, apply power to the AM-500 three (3) seconds before operating the device.

### CONNECTION FOR FAST SETTLING WITH GAIN OF -1

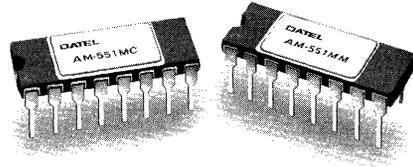

### ORDERING INFORMATION

| MODEL NO.   | OPERATING TEMP. RANGE | SEAL  |
|-------------|-----------------------|-------|
| AM-500GC    | 0 to +70 °C           | Epoxy |
| AM-500MC    | 0 to +70 °C           | Herm. |
| AM-500MM    | -55 to +125 °C        | Herm. |
| AM-500MM-QL | -55 to +125 °C        | Herm. |

### FEATURES

- 1 to 1000 Gain range
- $\pm 0.01\%$  Maximum nonlinearity
- 2 Microseconds settling time
- 100 dB CMRR

### GENERAL DESCRIPTION

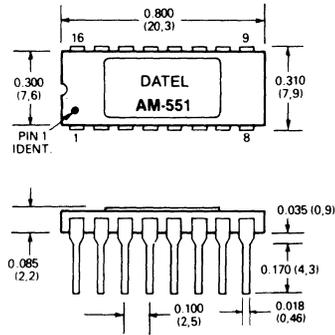

DATEL's AM-551 is a low cost, high performance, programmable gain instrumentation amplifier manufactured with hybrid thin-film technology. Gain is adjustable over a range of 1 to 1000 by the addition of a single external resistor and a simple user-selectable pin-strapping option. Maximum gain nonlinearity is  $\pm 0.01\%$ .

The AM-551 dynamic characteristics include a settling time of 2 microseconds for a 20V dc output step to 0.01% accuracy. Slew rate is 23V dc/microsecond and small signal bandwidth is 400 KHz. Other specifications include a common mode rejection ratio of 100 dB, a  $10^{12}\Omega$  input impedance and a minimum output voltage swing of  $\pm 11V$  dc. Maximum offset voltage drift is  $\pm 15$  microvolts/ $^{\circ}C$ .

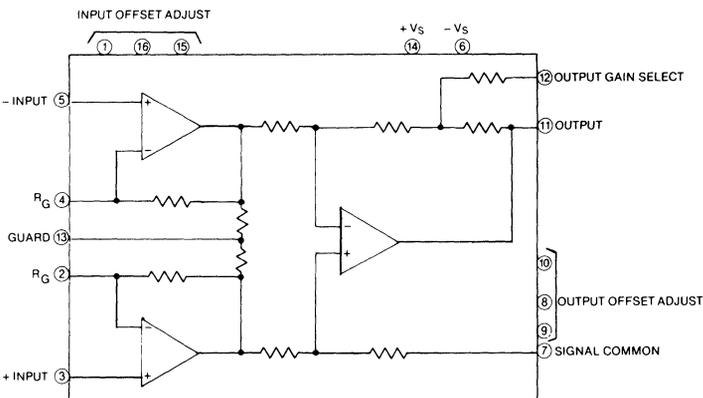

The combination of high accuracy, speed, low cost, and rugged hybrid construction make the AM-551 an ideal choice for applications involving the remote amplification of low-level signals produced by thermocouples, strain gages and RTD's, high performance data acquisition systems and remote instrumentation systems.

Power requirement is  $\pm 15V$  dc and all devices are cased in miniature, hermetically sealed, 16-pin ceramic packages. Models are available for operation over the commercial,  $0^{\circ}C$  to  $+70^{\circ}C$ , and military,  $-55^{\circ}C$  to  $+125^{\circ}C$  operating temperature ranges.

| Package Type  | 16 pin Ceramic DIP      |

### Footnotes:

- Adjustable to zero.
- At 1 KHz, for all gain ranges.
- To 0.01% accuracy. Higher gains degrade performance
- Tempco of R<sub>G</sub> = ±0 ppm/°C. For R<sub>G</sub> = ∞, Gain Tempco = 5 ppm/°C
- 1 kΩ Source Imbalance
- G<sub>2</sub> is the gain of the second stage of the AM-551. Connecting output gain select (pin 12) to the output (pin 11) sets the second stage gain at 1. Connecting output gain select (pin 12) to signal common (pin 7) sets the second stage gain at 10. R<sub>G</sub> is the gain resistor for the first stage and is connected to R<sub>G</sub> (pins 2, 4).

## TECHNICAL NOTES

- A 25 kΩ trimpot may be used for both input and output offset adjusts. The trimpot is connected across the input offset adjust pins (Pins 1, 15) and the wiper is connected to Pin 16.

For output offset adjust, the trimpot is connected across the output offset adjust pins (Pins 10, 9) with the wiper connected to Pin 8.

- For unity gain, R<sub>G</sub> is left open and the output gain select pin (Pin 12) is tied to the output pin (Pin 11). To avoid oscillation in the unity gain configuration, the connection between the output gain select pin and the output pin should be kept as short as possible.

- Gain selection is accomplished in two stages. The input stage gain (G<sub>1</sub>) is selected by an external gain resistor (R<sub>G</sub>) connected across the (R<sub>G</sub>) pins, (Pins 2, 4) and is expressed as follows:

$$G_1 = 1 + \frac{20k}{R_G}$$

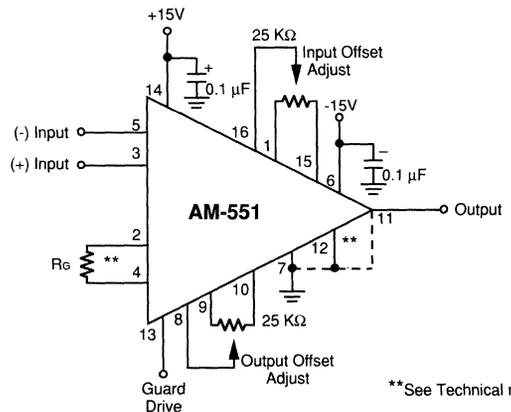

The output stage gain (G<sub>2</sub>) is selected by external pin-strapping: For G<sub>2</sub> = 1, connect the gain select pin (Pin 12) to the output pin (Pin 11). For G<sub>2</sub> = 10, connect the gain select pin (Pin 12) to the signal common pin (Pin 7).

The total gain of the amplifier is as follows:

$$G_T = G_1 \times G_2 = \left(1 + \frac{20k}{R_G}\right) G_2$$

- Both power supplies should be bypassed to ground with 0.1 microfarad electrolytic capacitors.

## TYPICAL CONNECTION DIAGRAM

## ORDERING INFORMATION

| MODEL NO. | OPERATING TEMP. RANGE |
|-----------|-----------------------|
| AM-551MC  | 0 to +70 °C           |
| AM-551MM  | -55 to +125 °C        |

## FEATURES

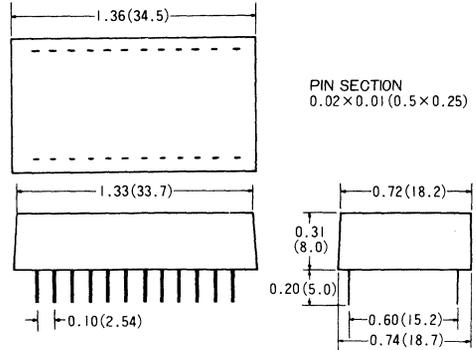

- Oscillation frequency is set by two external resistors
- Ultra low distortion: 0.0018% typical
- Stable
- Hybrid, small

## GENERAL DESCRIPTION

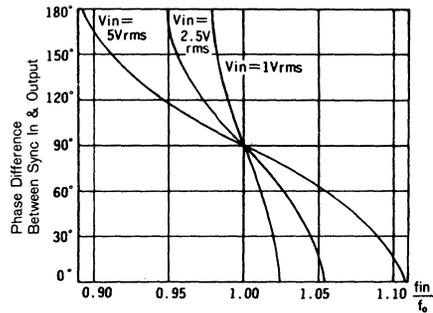

ROJ-20 and ROJ-1K are resistor tuneable oscillators whose oscillation frequency is set with two external resistors. Output frequency range of ROJ-20 is 20Hz to 20KHz while that of ROJ-1K is 1KHz to 100KHz. Output distortion is as low as 0.0018% typical at 1KHz frequency range. Output voltage temperature coefficient is also as low as 50ppm/°C. Output voltage amplitude is internally trimmed at 2.5Vrms  $\pm$ 0.5% and this amplitude is adjusted to the range from 500mV to 20Vp-p with external resistors. Sine and cosine waves are generated from two output terminals. A synchronization input terminal is provided in order to fine tune the relationship of these two outputs.

Hybrid construction has made it possible to build highly stable oscillators in small size at low cost.

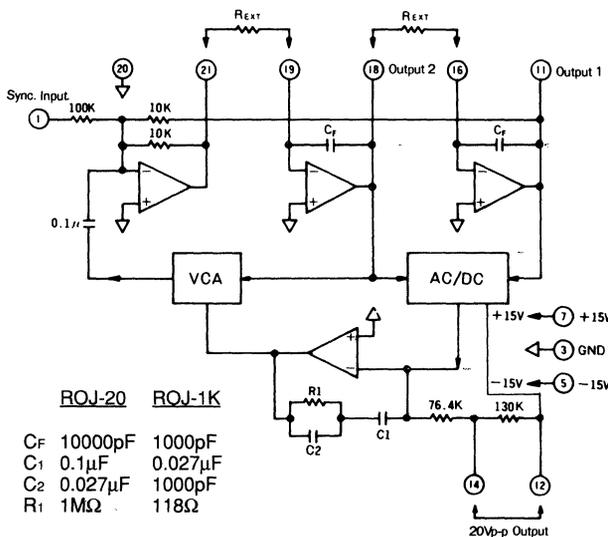

## MECHANICAL DIMENSIONS INCHES (mm)

## PHASE DIFFERENCE BETWEEN SYNC INPUT AND OUTPUT (Fig.6) (Technical Note 5)

$f_{in}$ : Sync Input Frequency  
 $f_o$ : Frequency when no Sync In is given.

## PIN CONNECTIONS

| PIN | FUNCTION              |

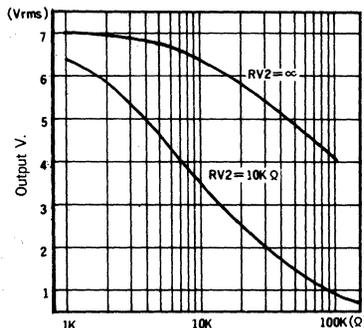

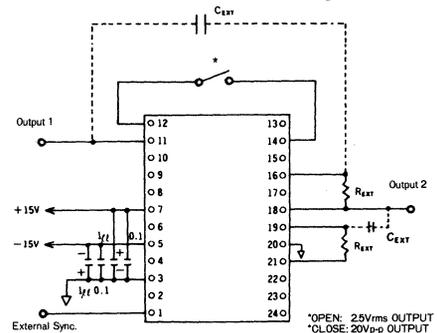

Figure 5b.

## TYPICAL CONNECTIONS (Fig. 3)

## TECHNICAL NOTES

- Typical connections are shown in Figure 3. Do not connect unused pins to any points. The external synchronization pin (Pin 1) is left open normally.
- Output voltage level is 20Vp-p when the pins 12 and 14 are connected, 2.5Vrms when these pins are disconnected.

Any output voltage level can be set using external resistors RV1 and RV2 as shown Figure 4-a and 5-a.

The curves 4-b and 5-b show approximate values. The use of potentiometers are recommended when an accurate level of output is desired.

- Output frequency can be slightly shifted toward lower frequency range if two Cext are added. See Figure 3. Relationship among Rext, Cext and fo are:

$$\text{ROJ-20} \quad R_{\text{ext}} = \frac{159}{(C_{\text{ext}} + 0.01) \times f_o} \text{ (Kohm)}$$

Cext : μF fo : Hz

$$\text{ROJ-1K} \quad R_{\text{ext}} = \frac{159}{(C_{\text{ext}} + 0.001) \times f_o} \text{ (Kohm)}$$

- Output frequency could become unstable if the capacitive load exceeds 100pF. The use of 50ohm resistor or an output buffer amplifier is recommended.
- Output frequency can be synchronized with the input from the pin 1. First, oscillate at nearly equal frequency to the one desired to be synchronized. Then, apply synchronization frequency to pin 1 at several Vrms level. Phase difference between synchronization input and output frequency vs. the frequency ratio is shown in Figure 6.

## ORDERING INFORMATION

| MODEL  | DESCRIPTION             |
|--------|-------------------------|
| ROJ-20 | 20 Hz to 20 KHz output  |
| ROJ-1K | 1 KHz to 100 KHz output |

# FLJ-ACO1 Oscillator Adaptor for FLJ-D Series

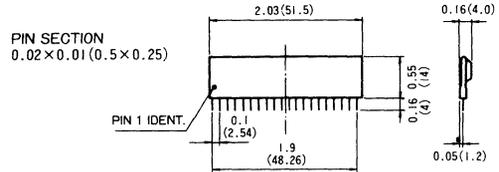

## FEATURES

- Output 2.5Vrms  $\pm 0.5\%$  accuracy
- 500mV ~ 20Vp-p wide amplitude range
- Single inline small package

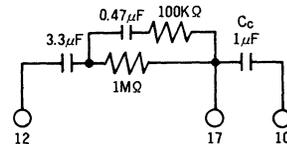

## GENERAL DESCRIPTION

FLJ-ACO1 is an accessory used with the FLJ-D1, D2 and DC filters to build a digitally programmable oscillator. The oscillator is controlled with 3 digits of BCD logic input. The setting method, set frequency accuracy and TC depend on the filters which are to be used with this FLJ-ACO1, but the specifications related to output voltage such as output voltage accuracy, stability and amplitude TC are determined by the FLJ-ACO1. The output voltage is trimmed internally to provide 2.5Vrms  $\pm 0.5\%$  output.

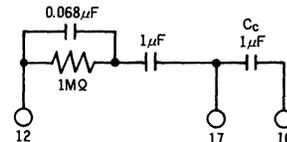

## MECHANICAL DIMENSIONS INCHES (mm)

## FLJ-D1 FOR LOWER FREQUENCY (Fig. 4)

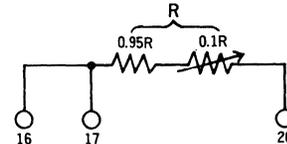

## FLJ-DC FOR LOWER FREQUENCY (Fig. 5)

Note: FLJ-D1 or FLJ-DC with 5000pF of Cext for lower than 10kHz oscillation, use one of these circuits.

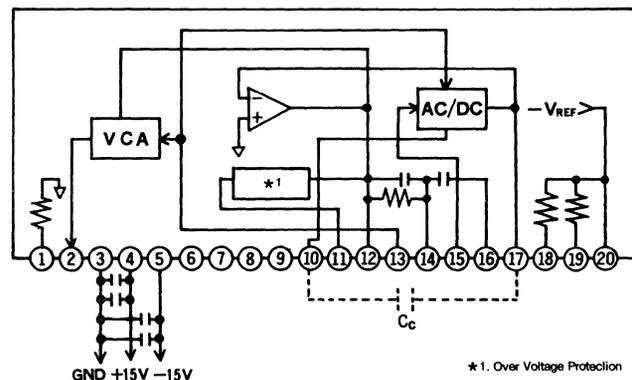

## OUTPUT VOLTAGE ADJUSTMENT (Fig. 6)

## PIN CONNECTIONS

| PIN | FUNCTION    | PIN | FUNCTION          |
|-----|-------------|-----|-------------------|
| 1   | Rq          | 11  | OUTPUT PROTECTION |
| 2   | LOOP OUTPUT | 12  | COMPENSATION 1    |
| 3   | GND         | 13  | SUB (-90°) OUTPUT |
| 4   | +15V Supply | 14  | COMPENSATION 3    |
| 5   | -15V Supply | 15  | MAIN OUTPUT       |
| 6   | NC          | 16  | -Vref IN          |
| 7   | NC          | 17  | COMPENSATION 2    |
| 8   | NC          | 18  | OUTPUT RANGE 1    |
| 9   | NC          | 19  | OUTPUT RANGE 2    |
| 10  | Cext        | 20  | -Vref OUT         |

DO NOT CONNECT NC PINS  
PIN 14 SHOULD BE LEFT OPEN NORMALLY.

## SPECIFICATIONS

Typical at 25 °C, with ±15V power supplies unless otherwise specified.

- \*1. 20V p-p with pin connections, other voltage output ranges are available with the use of external components.
- \*2. Expandable to wider range with the use of external components

## TECHNICAL NOTES

1. Oscillation frequency range varies depending on the Digital Tuneable Filter to be used with FLJ-ACO1.

- FLJ-D1 1 Hz ~ 1.599 KHz
- FLJ-D2 100 Hz ~ 159.9 KHz
- FLJ-DC Determined by external capacitors

Any model can be used connected as shown in Figure 3 to get the performance that meets the values shown in the specification table.

2. FLJ-DC needs two external capacitors. The relationship between capacitance and oscillation frequency  $f_c$  is:

$$f_c = \frac{N}{20 \cdot C_{ext}} \quad f_c: \text{Hz}, C_{ext}: \mu\text{F}$$

N: Digital Number

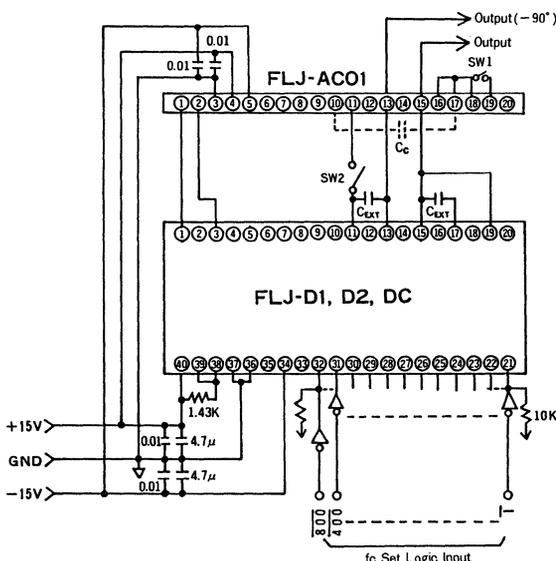

For example, once  $C_{ext}$  of 0.005  $\mu\text{F}$  and N of 1000 are given,  $f_c$  shall be 10 KHz. Therefore, with N of 1 to 1599,  $f_c$  can be set at any frequency of 10 Hz to 15.99 KHz range with BCD logic inputs.

- 3. Expansion to higher frequency range: The maximum frequency is 50 KHz for 20V p-p output even if FLJ-D2 is used. Connect pin 11 of both FLJ-DC and FLJ-ACO1 together to expand the oscillation frequency range to higher levels. Up to 100 KHz of frequency range is obtained for 20V p-p amplitude even though distortion ratio is slightly derated as the protection circuit in FLJ-ACO1 works. Up to 159.9 KHz of oscillation shall be available for 2.5 Vrms output with the same connection.
- 4. Distortion at lower frequency range shall be improved with the addition of a few external components.
  - a. With the FLJ-D1 connect as shown in Figure 4. As little as 0.01% distortion can be attained at 4 Hz oscillation.
  - b. With the FLJ-DC,  $C_{ext} = 5000 \text{ pF}$  connect as shown in Figure 5. Distortion at 10 Hz shall be improved to 0.005%.
- 5. Adjustment of output voltage: Normal 2.5 Vrms output voltage is obtained with SW1 of Figure 3 open and 20V p-p is obtained with SW1 closed. For other output voltage, follow Figure 6 and the following equation.

$$R = \frac{1111}{V_o(\text{rms})} \quad (\text{K}\Omega)$$

The range of  $V_o$  is 0.5 Vrms to 20V p-p.

TYPICAL CONNECTION (Fig. 3)

Note 1. Open SW1 and SW2 for 2.5Vrms output. Close SW1 and SW2 for 20Vp-p output.  
2. Two  $C_{ext}$  are required for FLJ-DC.

## ORDERING INFORMATION

| MODEL NO. | DESCRIPTION                                 |
|-----------|---|
| FLJ-ACO1  | Oscillator adapter for FLJ-D Series filters |

## FEATURES

- Cutoff frequency of resistor tuneable filters can be set with BCD logic.
- Single inline hybrid.
- Small size, low cost

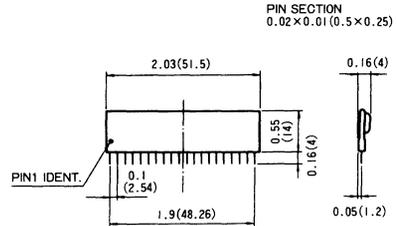

## GENERAL DESCRIPTION

FLJ-ACR series are logic controlled resistor networks. They are designed to be used with resistor tuneable filters such as FLJ-UR series.

Four separate resistor networks are included in one package. One network consists of four resistors such as R, R/2, R/4 and R/8. The value of R in FLJ-ACR1 is 1.59MΩ while that of FLJ-ACR2 is 150kΩ.

A combination of an FLJ-ACR and an FLJ-UR makes it possible to make a filter whose cutoff frequency or center frequency is set with BCD logic. It is also possible to use this resistor network in the negative feedback loop of an amplifier circuit and control the gain with BCD logic.

## MECHANICAL DIMENSIONS (Fig. 2) INCHES(mm)

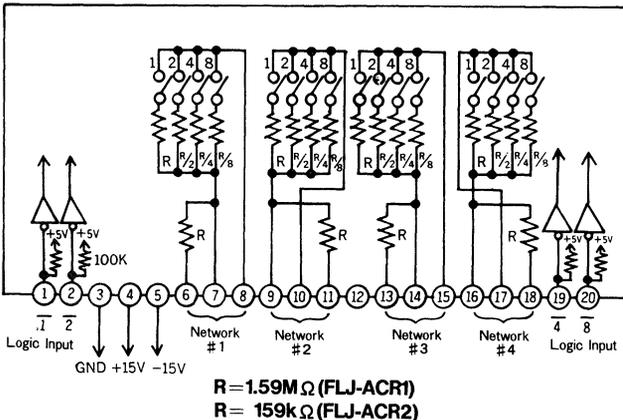

## FLJ-UR Series List

| Model No.  | fc Range         | No. of Pole | Type         |

\* Output saturates at 11V dc with zero logic code input (0000); however, digital code corresponds to value of fc directly.

## PERFORMANCE

Frequency Set Error ..... ±1% or less

**CONTROL CHARACTERISTICS** Logic Code ..... BCD 1 digit (1, 2, 4, 8)

Logic and Level ..... 0V: ON  
 +5V or Open: OFF

## POWER SUPPLIES AND ENVIRONMENT

Power Supply (Operating Range) ..... ±15V (±5V to ±18V)

Current ..... +6.2mA, -1.2mA

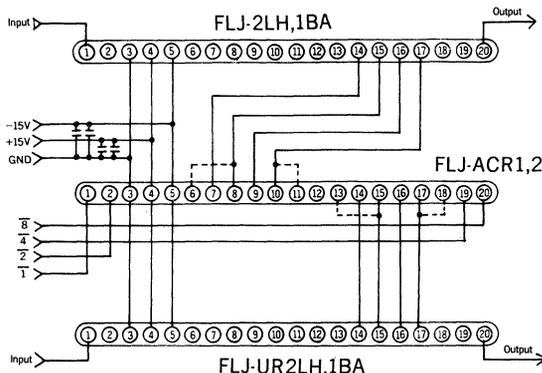

Operating Temperature Range ..... 0 to 70°C

Storage Temperature Range ..... -30°C to 80°C

Operating Humidity Range ..... 10% to 95% RH

Storage Temperature Range ..... 10% to 80% RH

**TYPICAL CONNECTION (Fig. 3)**

## ORDERING INFORMATION

**MODEL RESISTANCE**

FLJ-ACR1 1.59 MΩ  
 FLJ-ACR2 159 KΩ

for FLJ-UR Filter Series

## TECHNICAL NOTES

1. FLJ-ACR1 and FLJ-ARC2 contain four separate resistor networks which are controlled by common logic inputs. There are two types of FLJ-UR's (resistor tuneable filters) which are to be connected with FLJ-ACR's to build BCD Logic Programmable Filters. One type such as FLJ-UR2LH or FLJ-UR1BA requires two external resistors while all other FLJ-UR's require four external resistors to set a cutoff frequency. Therefore, one FLJ-ACR can control two FLJ-UR2LH's or FLJ-UR1BA's. See Figure 3.
2. BCD + 1 connections are made by connecting pins 6 to 8, 11 to 10, 13 to 15, and 18 to 17 on the units required per Table 1a. or 1b.

## FEATURES

- Cutoff frequency is set by logic inputs
- Lowpass, Highpass and Bandpass output functions are available simultaneously
- Gain and Q are set by external components
- High accuracy, high stable

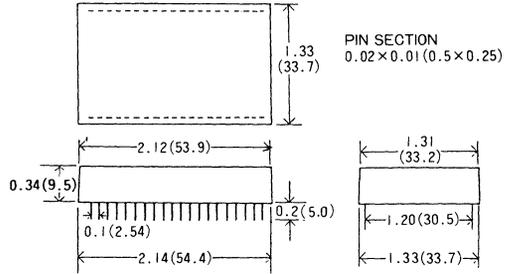

## GENERAL DESCRIPTION

FLJ-D1, D2, and DC are digitally programmable filters which can set the cutoff frequency and center frequency with 3 digit BCD inputs.

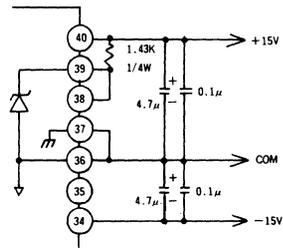

Two-pole lowpass, bandpass, and highpass output functions are available simultaneously from three different outputs and notch function is available by combining these outputs to the uncommitted op amp.

To realize higher order filters, several filters can be cascaded. And to obtain higher performance of higher order filters, both Gain and Q are designed to be set with external components.

## TECHNICAL NOTES

- The cutoff frequency of lowpass and highpass, and the center frequency of bandpass filters can be set with three digit BCD, TTL compatible logic inputs. The MSD is hexadecimal. See Table 2.
- The cutoff frequency is shown as either one equation of the following:

$$f_c = \frac{N}{20 \cdot C} \text{ Hz, } C : \mu\text{F, } N : \text{Digital Number}$$

$$f_c = \frac{N}{2\pi \cdot C \cdot R_f} \text{ Hz, } C : \text{F, } R_f : \Omega, N : \text{Digital Number}$$

C = 50,000pF is contained in FLJ-D1 and C = 500pF is contained in FLJ-D2 respectively, while no capacitor is contained in FLJ-DC.

The  $f_c$ 's of each model are:

$$\text{FLJ-D1 : } f_c = N \text{ or } f_c = \frac{N}{2\pi \cdot 5 \times 10^{-8} \cdot R_f}$$

$$\text{FLJ-D2 : } f_c = 100N \text{ or } f_c = \frac{N}{2\pi \cdot 5 \times 10^{-10} \cdot R_f}$$

$$\text{FLJ-DC : } f_c = \frac{N}{20 \cdot C} \text{ or } f_c = \frac{N}{2\pi \cdot C_{ext} \cdot R_f}$$

The value of  $R_f$  is 3.183 MΩ.

The value of  $C_{ext}$  is calculated taking these factors into consideration.

- Each logic input is connected to CMOS4000 series internally. Then each input is pulled down with 100KΩ resistors. The use of 10KΩ pull-up resistors to +5V is recommended when filters are programmed with TTL logic.
- An independent +5V zener diode is contained in the filter. The output voltage range of this diode is +4.87V ~ +5.12V. The connection shown in Figure 3 is recommended if a filter is driven by ±15V supplies only.
- Analog GND (Pin36) and logic GND (Pin37) are separated. Connect grounds of ±15V and +5V externally. No return current of the digital power supply should flow through the analog ground.
- The use of 4.7µF and 0.1µF bypass capacitors for both ±15V and +5V lines close to the module is highly recommended.

LOGIC INPUT CODING TABLE (Table 2)

| Logic Input *1 |         |         | Decimal Number | fc(Cutoff Frequency) |          |          |

| 1 0 1 0        | 0 0 0 0 | 0 0 0 0 | 1000           | 1000                 | 100      | 100      |
| 1 1 0 0        | 0 0 0 0 | 0 0 0 0 | 1200           | 1200                 | 120      | 120      |
| 1 1 1 0        | 0 0 0 0 | 0 0 0 0 | 1400           | 1400                 | 140      | 140      |
| 1 1 1 1        | 0 0 0 0 | 0 0 0 0 | 1500           | 1500                 | 150      | 150      |
| 1 1 1 1        | 1 0 0 1 | 1 0 0 1 | 1599           | 1599Hz               | 159.9KHz | 159.9Hz  |

Note: \*1. Logic 1 = +5V  
 Logic 0 = GND or OPEN  
 \*2. FLJ-DC needs external capacitors.  
 These values are ones when two 0.5μF are used as external capacitors.

**GAIN AND Q**

The gain and Q of these filters are set with the following equations.

1. Lowpass and highpass filters

$$\text{Gain: } G = \frac{-1}{R_g} \times 10^4 \text{ (} R_g : \Omega \text{)}$$

$$Q: Q = \frac{R_g \cdot (R_q + 10^4)}{R_q \cdot (2R_g + 10^4)}$$

$$R_g = 10K\Omega \text{ when } G = -1. \text{ Then, } R_q = \frac{10^4}{3Q-1}$$

Then, the following values are obtained:

|             | Q       | Rq      |
|-------------|---------|---------|
| Butterworth | 0.70711 | 8.918KΩ |
| Bessel      | 0.57735 | 13.66KΩ |

See Figures 4 and 5 for "Amplitude/Phase vs. Frequency" characteristics, and Figure 7 for typical connections.

2. Bandpass filter

$$\text{Gain: } G = \frac{-1}{R_g} \times 10^4 \text{ (} R_g : \Omega \text{)}$$

$$Q: Q = \frac{1 + (1/R_g + 1/R_q) \cdot 10^4}{2}$$

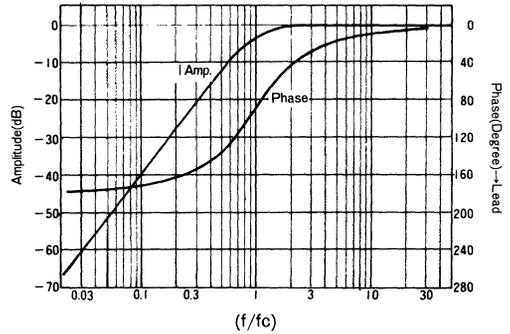

$$R_g = 10K\Omega \text{ when } G = -1. \text{ Then, } R_q = \frac{10^4}{2(Q-1)}$$

Then, the following values are obtained:

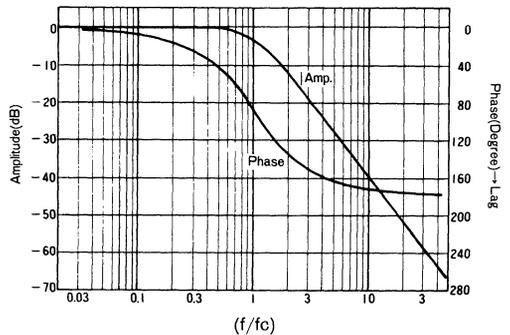

| Q  | Rq     |
|----|--------|
| 2  | 5.00KΩ |
| 5  | 1.25KΩ |
| 10 | 556Ω   |

See Figure 6 for amplitude vs. frequency characteristics and Figure 8 for typical connections.

| ORDERING INFORMATION |                     |
|----------------------|---------------------|
| MODEL                | OUTPUT fc           |
| FLJ-D1               | 1 Hz to 1.599 KHz   |
| FLJ-D2               | 100 Hz to 159.9 KHz |
| FLJ-DC               | 0.1 Hz to 159.9 KHz |

## FEATURES

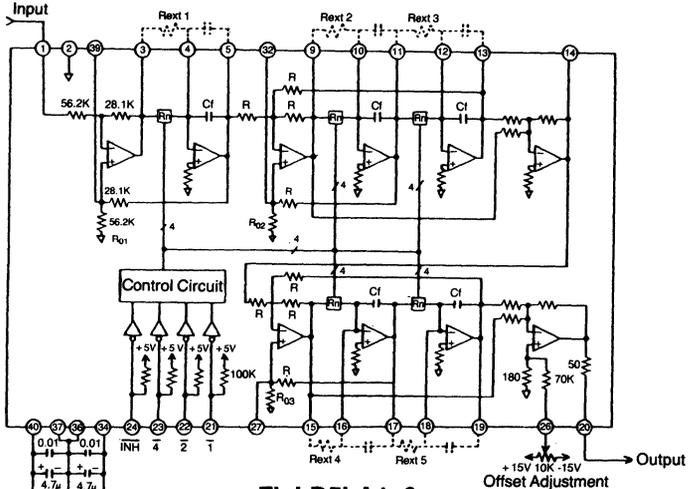

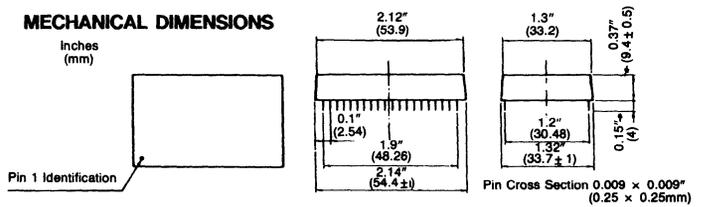

- 60dB, 80dB/octave rolloff low-pass filter
- Cutoff frequency programmed by logic at 8 points
- Compact, lightweight, hybrid IC construction

## GENERAL DESCRIPTION

FLJ-D5, and D6 series are lowpass filters that, although compact, have higher order and high attenuation performance. They are Chebyshev type filters. The FLJ-D5LA is a 5-pole filter which has a rolloff of 60 dB/oct and the FLJ-D6LA is a 6-pole filter with a rolloff of 80 dB/oct. The cutoff frequency is programmed with 3-bit, TTL-compatible digital logic and the settings can be changed to 8 different levels. Cutoff frequency range of the lower range type (which has suffix 1) is 10Hz-2KHz, and the higher range type (with suffix 2) is 100Hz-20KHz.

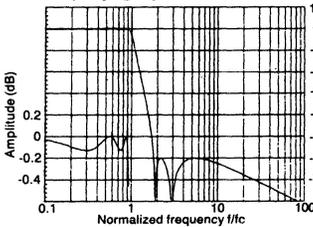

Ripple within the pass band is minimal at 0.13dBp-p and the distortion rate is held extremely low at 0.05%. These filters are optimal as anti-aliasing filters in A/D conversion circuits of data acquisition systems.

## MECHANICAL DIMENSIONS

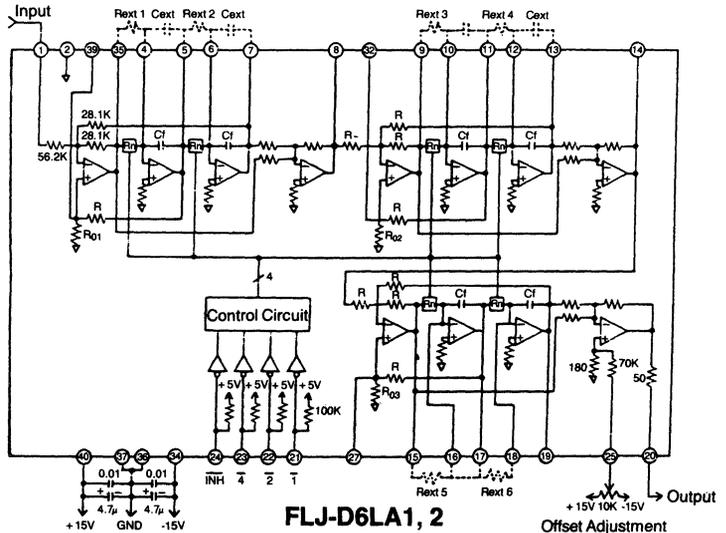

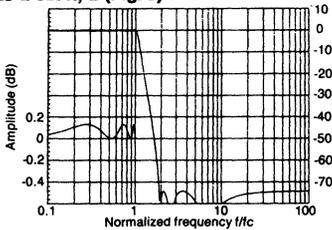

Cf in the diagram is 10000pF for the Suffix 1 model and 1000pF for the Suffix 2 model.

FLJ-D5LA1, 2 (Fig. 4)

FLJ-D6LA1, 2 (Fig. 5)

Cf in the diagram is 10000pF for the Suffix 1 model and 1000pF for the Suffix 2 model.

## SPECIFICATIONS (Table 1)

Typical at 25°C and ±15V supply voltage unless otherwise specified.

### ABSOLUTE RATINGS

|                            |       |

## TECHNICAL NOTES

1. A switching-type power supply is not recommended. Install 0.01 μF multilayer ceramic and 4.7 μF tantalum bypass capacitors in parallel as close to the filter as possible.
2. Each logic input (Pins 21-24) which programs the cutoff frequency has an internal analog comparator as shown in Fig. 6. External logic signals are TTL-compatible.
3. The fc setting input logic is negative true. Terminal open or +5V represents logic "0", while GND level is logic "1". The INH terminal is used normally open. Once INH is given logic "1", all 4, 2 and T logic inputs are inhibited and all internal resistor network switches are opened. The fc setting with external resistors becomes available with logic "1" at this INH terminal. The relationship between fc and the external resistors in this case is as follows:

FLJ-D5LA1 (Low Range Type)

$$R_{ext1} = \frac{31.423 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext2} = R_{ext3} = \frac{21.399 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext4} = R_{ext5} = \frac{16.358 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

FLJ-D6LA1 (Low Range Type)

$$R_{ext1} = R_{ext2} = \frac{29.622 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext3} = R_{ext4} = \frac{18.633 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext5} = R_{ext6} = \frac{15.215 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

FLJ-D5LA2 (High Range Type)

$$R_{ext1} = \frac{314.23 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext2} = R_{ext3} = \frac{213.99 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext4} = R_{ext5} = \frac{163.58 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

FLJ-D6LA2 (High Range Type)

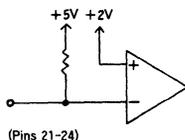

$$R_{ext1} = R_{ext2} = \frac{296.22 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

$$R_{ext3} = R_{ext4} = \frac{186.33 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

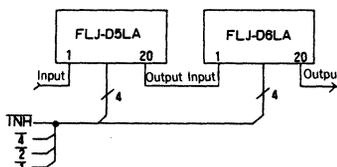

$$R_{ext5} = R_{ext6} = \frac{152.15 \times 10^3}{f_c \text{ (Hz)}} \text{ (K}\Omega\text{)}$$

4. An 11-pole ultra-high attenuation filter is available once cascaded as shown in Fig. 7. As can be seen from the curves (Figs. 4,5), the amplitude of the ripple in the pass band is reversed between FLJ-D5LA and FLJ-D6LA. As a result, when connected in a cascade, the pass band ripple amplitude is greatly reduced, and moreover, the rolloff becomes steeper.
5. For filters that have been constructed like those in this series, it is not recommended to change the fc setting range with external capacitors. This is because trimming of the internal constants is performed with pairs of internal resistors and capacitors. Although shifting to a lower fc setting range is possible through the addition of external capacitors, in this case a change will result in ripple amplitude.

## ORDERING INFORMATION

Low Cutoff Frequency Type  
 (10Hz-2KHz)  
 FLJ-D5LA1: 60dB/oct., 5-pole  
 FLJ-D6LA1: 80dB/oct., 6-pole  
 High Cutoff Frequency Type  
 (100Hz-20KHz)  
 FLJ-D5LA2: 60dB/oct., 5-pole  
 FLJ-D6LA2: 80dB/oct., 6-pole

## FEATURES

- 135dB, 100dB/octave high order, lowpass filter
- 1/3 octave bandwidth ( $Q=4.32$ ) bandpass filter
- Can set cutoff ( $f_c$ ) frequency with 6 or 8 external resistors
- Ultra-compact size, high-function hybrid construction

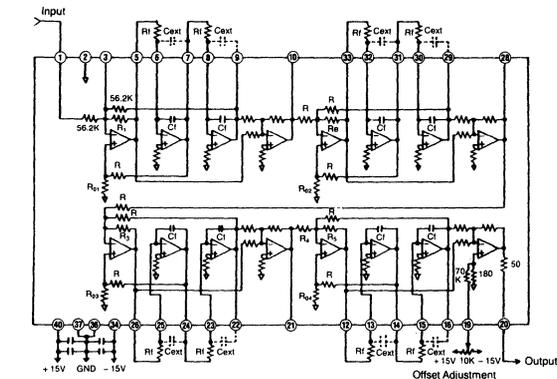

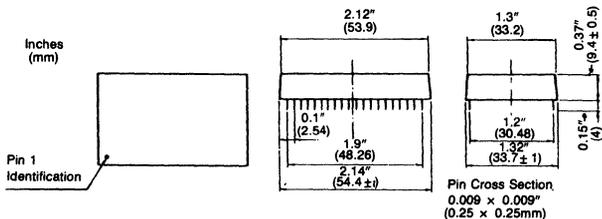

## GENERAL DESCRIPTION

The FLJ-R series filters are of the highest order and have the highest attenuation characteristics among the entire group of DATEL filter products. Through the use of hybrid techniques, even though compact in size, the FLJ-R series filters have complete 8-pole lowpass and 3-pole pair bandpass filter functions. The cutoff (central) frequency can be set with only 6 or 8 external resistors.

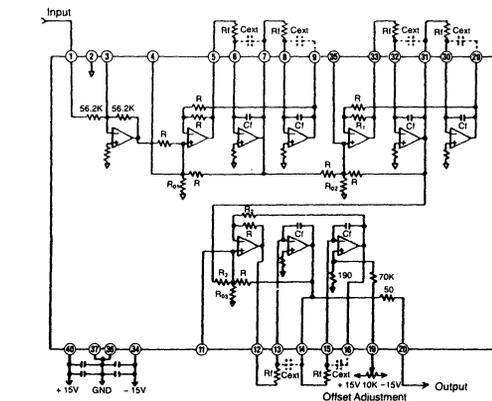

Bandpass ripple in the lowpass filter is 0.1dB and boasts outstanding performance with the distortion ratios for all models being a mere 0.005%. Each model is composed of the Suffix 1 and Suffix 2 types and varies according to cutoff frequency setting range. The Suffix 1 model has a range from 10Hz-2KHz and the Suffix 2 model has a range from 100Hz-20KHz. The FLJ-R series filters are optimum as anti-aliasing filters in A/D conversion circuits of data acquisition systems.

The FLJ-R3BA1, 2 are 1/3 octave, bandpass filters that meet IEC-225 Standard requirements.

## TECHNICAL NOTES

1. Setting the cutoff (central) frequency is accomplished with 8 external resistors which are equal in value for low-pass filters and 6 external resistors which are equal in value for bandpass filters. The relationship between the resistance Rf of the external resistors and the cutoff frequency fc is as follows:

$$\text{Suffix 1 model (10Hz-2KHz)} \quad \text{Suffix 2 model (100Hz-20KHz)}$$

$$Rf = \frac{15.9 \times 10^3}{fc} (K\Omega) \quad Rf = \frac{159 \times 10^2}{fc} (K\Omega)$$

where fc is measured in Hz.

The FC setting range can be shifted to a lower band by adding external capacitors Cext. The equation shown below should be used for reference.

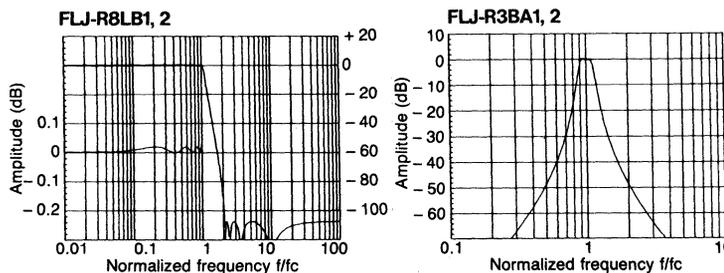

$$\text{Suffix 1 model} \quad \text{Suffix 2 model}$$

$$Cext = \frac{159}{(Cext + 0.01) \times fc} (K\Omega) \quad Cext = \frac{159}{(Cext + 0.001) \times fc} (K\Omega)$$

where Cext is measured in μF and fc in Hz.

In this case, the external capacitors should have high dielectric characteristics. It is recommended to use multi-layer ceramic capacitors. Further, tolerance of these capacitors should be within ±0.25%. For filters such as these of higher order and with high attenuation characteristics, the uniformity of the tolerance of external resistors and capacitors has an effect not only on the accuracy of the setting range, but also on the size of pass band ripple.

- Use series type power supplies for the ±15V power supplies because switching-type power supplies are not recommended. Install 4.7μF tantalum and 0.01μF multilayer ceramic bypass capacitors. It is recommended that these be installed in parallel, and as close to the filter as possible, between the ±15V power supplies and ground.
- Use metal film resistors with a tolerance better than 1% for the 6 or 8 fc setting resistors.

## ORDERING INFORMATION

Low Cutoff Frequency Type (10Hz-2KHz)

- FLJ-R8LA1: 135dB/oct., 8-pole
- FLJ-R8LB1: 100dB/oct., 8-pole
- FLJ-R3BA1: 3-pole pair bandpass

High Cutoff Frequency Type (100Hz-20KHz)

- FLJ-R8LA2: 135dB/oct., 8-pole
- FLJ-R8LB2: 100dB/oct., 8-pole
- FLJ-R3BA2: 3-pole pair bandpass

## FEATURES

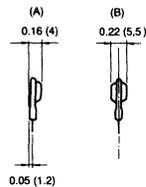

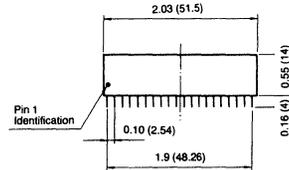

- Small and thin size
- A variety of families
- Cutoff frequency  $f_c$  is set by only two or four resistors
- Light weight, low cost

## GENERAL DESCRIPTION

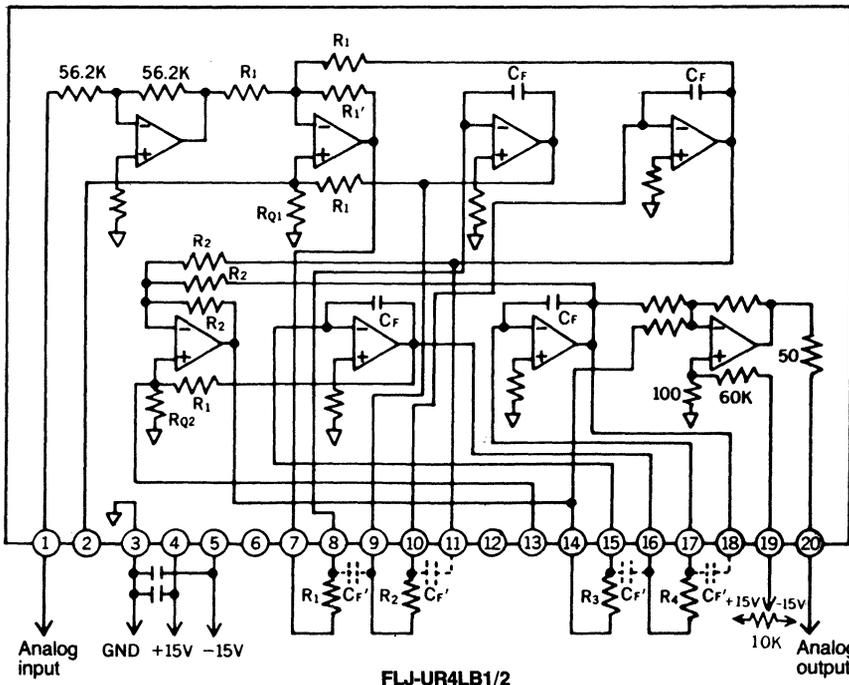

The FLJ-UR series filters are single in-line package resistor tuneable filters. They are small in size and can reduce installation space on the printed circuit board. The cutoff frequency can be easily set by only two or four external resistors. The series has a variety of products, allowing system designers flexibility in selecting filters to suit their application.

\*1: Addition of 2 or 4 external capacitors allow extension to lower band.

\*2: FLJ-UR4LA, 4LB, fc/10, FLJ-UR4HA, 3.3 fc, FLJ-UR4HB: 10 fc (fc≤3 kHz), 3.3 fc (fc>3 kHz)  
 FLJ-UR2LH: fc/10 (LPF), 10 fc (HPF)

\*3: Gain of 0 dB at above stated frequencies. (See \*2)

\*4: Connection of a specified pin to GND allow 10, 20, 30, 40 and 50. External resistors allow a range of 1.81≤Q≤50.

**TECHNICAL NOTES**

1. Do not use a switching regulator. Use a well regulated  $\pm 15V$  power supply. Install  $0.01 \mu F$  bypass capacitors as close to the filter as possible.
2. Use metal film resistors of 1% tolerance for  $f_c$  setting. When making a higher-order filter, use more accurate resistors.
3. Connect external resistors with short leads as close to the filter as possible.
4. Use external capacitors with good stability and high dielectric resistance. It is recommended to use multilayer ceramic capacitors or plastic film capacitors.
5. Regulate output offset voltage by using an external trimmer ( $10 K\Omega$  to  $50 K\Omega$ ).
6. The FLJ-UR series filters are packaged single inline and are compact in size. Installation at high-density may cause temperature rises between elements. Installation with  $0.8''$  or more of space between filters can eliminate the problem.
7. Relation between  $f_c$  and external resistor/capacitor:  
With the FLJ-UR series, a cutoff or center frequency can be set by 2 or 4 external resistors. The values of R of 2 or 4 external resistors for normal use can be calculated as;

$$R = \frac{15.9 \times 10^6}{f_c \text{ (Hz)}} \text{ (}\Omega\text{) Suffix 1 model}$$

$$R = \frac{159 \times 10^6}{f_c \text{ (Hz)}} \text{ (}\Omega\text{) Suffix 2 model}$$

Note:  $R_1 = R_2 = R_3 = R_4$

In certain applications the resistance of each of 2 or 4 resistors may be changed.  $R_1$  to  $R_4$  shown in the block diagrams are the external resistors explained here. In standard use, the  $f_c$  can be set to a minimum of 40 Hz. This is because the values of R have to be increased to about 400K according to the relation between R and  $f_c$ . The  $f_c$  setting range can be expanded to lower band by adding 2 or 4 external capacitors.

$$R = \frac{159 \times 10^3}{(\text{Cext} + 0.01) f_c} \text{ (}\Omega\text{) Suffix 1 model}$$

$$R = \frac{159 \times 10^3}{(\text{Cext} + 0.001) f_c} \text{ (}\Omega\text{) Suffix 2 model}$$

where Cext is measured in  $\mu F$  and  $f_c$  in Hz.

In the applications in which the output offset, time drift, or output noise must be minimal, use the above external capacitors if the values of external resistors exceed  $100 K\Omega$  each.

8. How to tune  $f_c$   
As shown in the specifications, the  $f_c$  setting accuracy is 3% depending on the accuracy of elements used. There is no practical problem in tuning when they are used as low-pass or highpass filters. However, bandpass filters and band elimination filters may require sharp tuning. Such filters can be tuned with external trimmers as shown in Fig. 10.  $R_1$ ,  $R_2$  and  $VR_1$  are not used with the FLJ-UR1BA1/2.

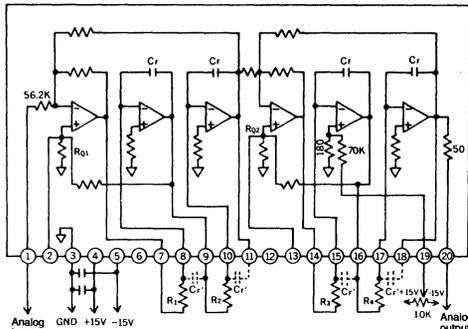

**a. FLJ-UR1BA1/2**

- An input signal of oscillating frequency  $f_c$  is given.
- I/O signals are monitored with a phase measuring instrument such as an oscilloscope.
- Tune  $VR_2$  until the phase difference between I/O signals can be reduced to  $0^\circ$ .

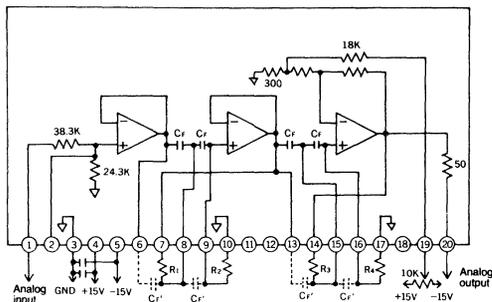

**b. FLJ-UR2BA1/2**

- An input frequency of  $1.0734 \times f_c$  is provided.
- Tune  $VR_1$  until the phase difference between the input signal and the output signal at pin 9 reaches at  $180^\circ$  looking at a phase measuring instrument such as an oscilloscope.
- An input signal of frequency  $f_c$  is given.
- Tune  $VR_2$  until the phase difference between the input signal and the output signal at pin 20 is set at  $0^\circ$ .

Cf in each figure is 10000 pF for suffix 1 model and 1000 pF for suffix 2 model.

## ORDERING INFORMATION

### LOW CUTOFF FREQUENCY TYPE (40 Hz~1.6 kHz)

- FLJ-UR4LA1: 4-pole lowpass, Butterworth
- FLJ-UR4LB1: 4-pole lowpass, Chebyshev
- FLJ-UR4HA1: 4-pole highpass, Butterworth
- FLJ-UR4HB1: 4-pole highpass, Chebyshev
- FLJ-UR2LH1: 2-pole lowpass/highpass, Butterworth
- FLJ-UR1BA1: 1-pole pair bandpass, Butterworth
- FLJ-UR2BA1: 2-pole pair bandpass, Butterworth
- FLJ-UR2EA1: 2-pole pair band elimination, Butterworth

### HIGH CUTOFF FREQUENCY TYPE (400 Hz~5 k/10 k/ 20 kHz)

- FLJ-UR4LA2: 4-pole lowpass, Butterworth
- FLJ-UR4LB2: 4-pole lowpass, Chebyshev
- FLJ-UR4HA2: 4-pole highpass, Butterworth
- FLJ-UR4HB2: 4-pole highpass, Chebyshev
- FLJ-UR2LH2: 2-pole highpass/lowpass, Butterworth
- FLJ-UR1BA2: 1-pole pair bandpass, Butterworth
- FLJ-UR2BA2: 2-pole pair bandpass, Butterworth
- FLJ-UR2EA2: 2-pole pair band elimination, Butterworth

## FEATURES

- Cutoff frequency is tuned by external voltage
- Wide range of control frequency
- Small in hybrid

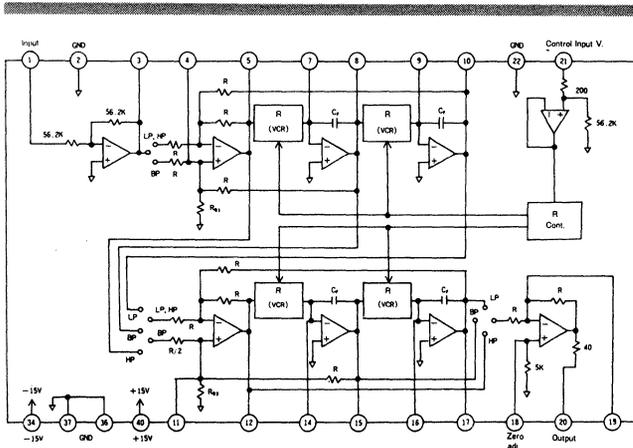

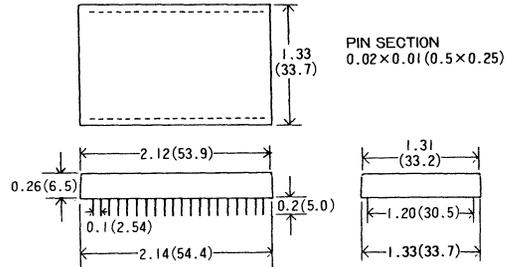

## GENERAL DESCRIPTION

FLJ-V Series filters cutoff frequency or center frequency can be set with an external control voltage.

Hybrid construction has made it possible to build highly reliable, high performance filters in small size at low cost.

FLJ-VL is a lowpass filter and FLJ-VH is a highpass filter. Both filters have 24dB/oct of rolloff characteristics. FLJ-VB is a bandpass filter which has 12dB/octBW at  $Q=5$ .

## MECHANICAL DIMENSIONS INCHES(mm)

## PIN CONNECTIONS

| PIN | FUNCTION     | PIN | FUNCTION         |

① Typically <300 µVrms for the FLJ-VH. The FLJ-VL/VB are typically <300 µVrms for control voltages up to 2V and <500µVrms for control voltages from 2 to 10 Volts.

## TECHNICAL NOTES

- The rated input voltage is ±1V. The maximum performance is obtained if input voltage does not exceed this range.
- These filters are 4pole Butterworth(2pole pair) filters. Cutoff frequency is controlled by external voltage. The relationship between control voltage and cutoff frequency is linear (=proportional). Cutoff frequency ranges can be shifted toward lower frequency region if four external capacitors are added. See Figure 3.  
FLJ-VL:  

$$C_{ext1}, C_{ext2} = \frac{1}{f_c(\max) \times 2\pi \times 6.36 \times 10^3} - 250 \times 10^{-12}$$
 FLJ-VB, VH:  

$$C_{ext1}, C_{ext2} = \frac{1}{f_c(\max) \times 2\pi \times 6.36 \times 10^3} - 1250 \times 10^{-12}$$
 Cext1, Cext2 : F (Farad)  
 fc(max) : -3dB frequency at 10V control voltage.
- Zero offset adjustment range is approximately ±50mV.
- Control input voltage signal has approximately 10KHz of frequency response. However, it takes long time before the output DC offset (=approx. 10mV) settles under the new fc

set. It is not recommended to use alternating signals for the control input, depending on applications. The cutoff frequency shall be affected by unstable control voltage if it is small signal, even if, it is DC.

- FLJ-VL can be used as Bessel filter. Connect Rq1 = 95.3KΩ and Rq2 = 9.53KΩ as shown Figure 3. External capacitors should be:

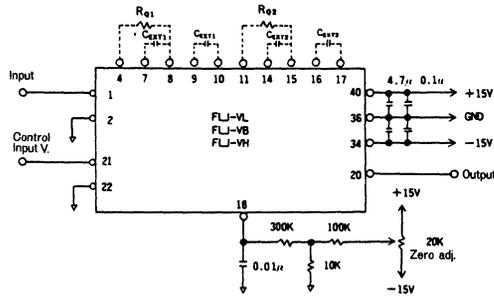

$$C_{ext1} = 250 \left( \frac{100}{f_c(\max) \text{ (KHz)} \times 1.43241} - 1 \right)$$

$$C_{ext2} = 250 \left( \frac{100}{f_c(\max) \text{ (KHz)} \times 1.60594} - 1 \right)$$

fc(max) ≤ 62.2KHz, -3dB frequency at 10V control input voltage.

## FEATURES

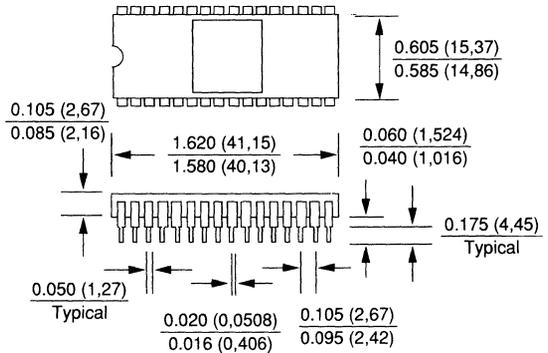

- Digital tuning
- Stopband attenuation >76dB at 3f<sub>c</sub>
- Built-in sample-hold
- Programmable gain of 1, 2, 4, 8
- Dynamic range of 85dB
- 12-Bit precision

## DESCRIPTION

DATEL's Model FLT-C1 is a monolithic, 7th order, lowpass active filter for applications requiring sharp, fast attenuation rolloff. Exceptionally low noise performance of this switched capacitor filter permit it to be used in applications requiring 12-bit accuracy.

A combination of an 8-bit control input and the clock frequency set the corner frequency over a range of 78 Hz to 20 KHz. A 2-bit control input selects the gain. A built-in oscillator (less crystal) is provided for systems where a system clock is not available.

① Also internal clock frequency. Internal clock requires external crystal.

## FUNCTIONAL DESCRIPTION

The FLT-C1 is made up of two programmable filter sections used in different combinations to meet various applications.

The **switched capacitor stage** (SCF), is a 7-pole, lowpass filter designed to provide an accurate, programmable passband for fixed or dynamic applications.

The switching frequency may be derived either from a crystal oscillator or from a system clock. Since the filter band edge can be programmed by varying the frequency of the clock which controls the filter's switches, it can track the sample rate of an external A/D converter. Digital programming allows for band edges of up to 20 KHz and gains of 1, 2, 4, or 8.

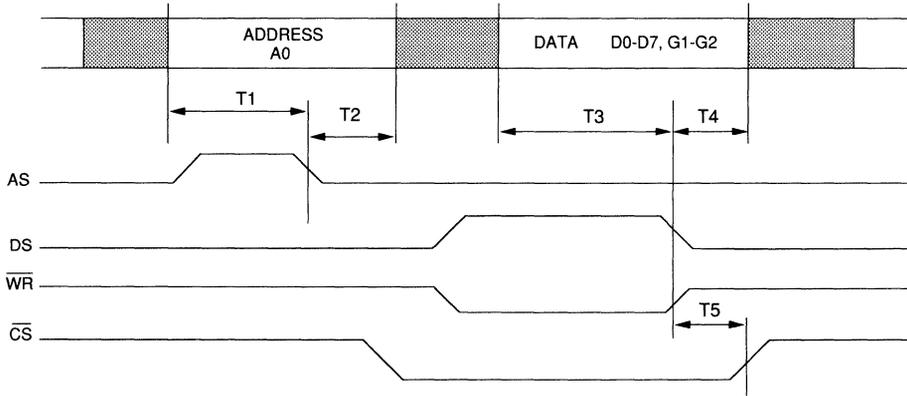

The **RC filter stage** is a low-order active filter with a band-edge accuracy of 5%. This accuracy is adequate because the filter sampling rate is 50 times greater than the band edge frequency.

| Name   | Function  |
|--------|---|
| Vss    | Negative supply voltage.  |
| CS     | Chip select; active low.  |
| G1-G2  | The digital inputs that control the DC gain of the SC filter.   |
| D0-D7  | The digital inputs that control the RC filter band edge, SC filter band edge, and SC filter decimation rate.  |
| SYNC   | This digital input controls the sampling instant for the SC filter decimated output; active low.  |
| CLKOUT | Master clock output capable of driving 1 standard TTL load. It is a buffered version of either CLKIN or the internally generated crystal oscillator output. |
| VDD    | Positive supply voltage   |
| CNVRT  | This digital output indicates that the SCOUT output has settled and can now be converted or sampled (drive capability is 1 standard TTL load); active low.  |
| X1-X2  | An external crystal is connected between these pins to generate an accurate clock for chip operation.   |
| CLKIN  | The master clock input. Forcing CLKIN to Vss enables the on-chip oscillator (external crystal).   |
| GND    | Ground.   |
| SCOUT  | SC filter output.   |
| PD     | This digital input is used to power down the analog circuitry; active low.  |
| RCOUT  | RC filter output.   |
| RCIN   | RC filter input.  |
| SCIN   | SC filter input (only valid when AA/SM is forced low).  |
| WR     | Write strobe; active low.   |
| DS     | Data strobe.  |
| AA/SM  | This digital input controls whether the input to the SC filter comes from RCOUT or SCIN.  |
| AS     | Address strobe.   |
| A0     | Register address select.  |

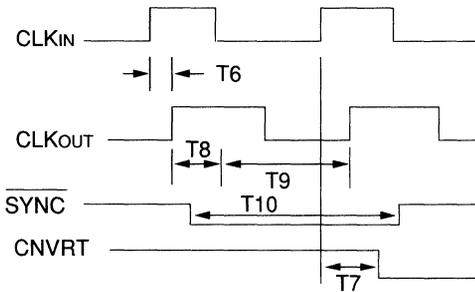

The band edge of the RC filter is programmable to insure sufficient rejection of any SC filter harmonics. Ratio matching of on-chip resistors and capacitors provides eight RC filter band-edges spanning a 12-to-1 range.

A decimator, placed at the output of the SC filter, samples the differential output and converts it to a single-ended signal. In addition, the decimator can be programmed to allow an integer decrease in the sampling rate by low filtering of the signal and keeping every Nth sample, similar to a programmable sample-hold. By choosing the proper decimation rate, the hold time at SCOUT will be long enough to allow an A/D conversion to take place without the need of external S/H components. An external S/H is recommended for hold times faster than 100 μS to prevent more than 1/2 LSB of droop for a 12-bit A/D conversion.

Microprocessor Interface Timing Characteristics

SC<sub>out</sub> Synchronization Timing

| μP Interface Timing | Ref. | Duration       |

### FEATURES

- Digitally programmable
- 4- and 5-Pole Causer response
- Cascadable 7 Pole Causer response
- Cutoff Frequencies to 1.2 MHz
- Small 32-pin DIP
- -55 °C to +125 °C operation

### GENERAL DESCRIPTION

DATEL's FLT-DL series of 4- and 5-pole digitally programmable active filters are functionally complete, simple to use, and offer a wide range of frequency response options. The models offered operate over the frequency ranges of 100 KHz to 470 KHz and 250 KHz to 1200 KHz.

The FLT-DL Series are Causer response filters which can be cascaded to provide equivalent 7 pole Causer performance.

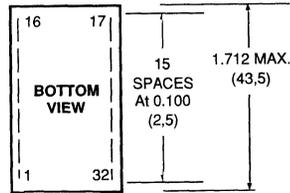

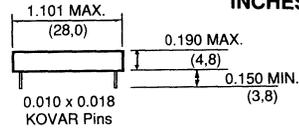

DATEL's FLT-DL Series filters are manufactured using thick-film and thin-film hybrid technology and unique laser trimming schemes. These filters are packaged in a space-saving 32-pin ceramic DIP. Units are specified for operation over the commercial temperature range of 0 to +70 °C and the military temperature range of -55 to +125 °C.

### TECHNICAL NOTES

1. Use an external 50 Kohm potentiometer to reduce the small initial offset error to zero. Tie the wiper to pin 18, OFFSET ADJUST. Connect the other terminals of the potentiometer to the +/-15 volt power supplies. For operation without adjustments, leave pin 18 unconnected.

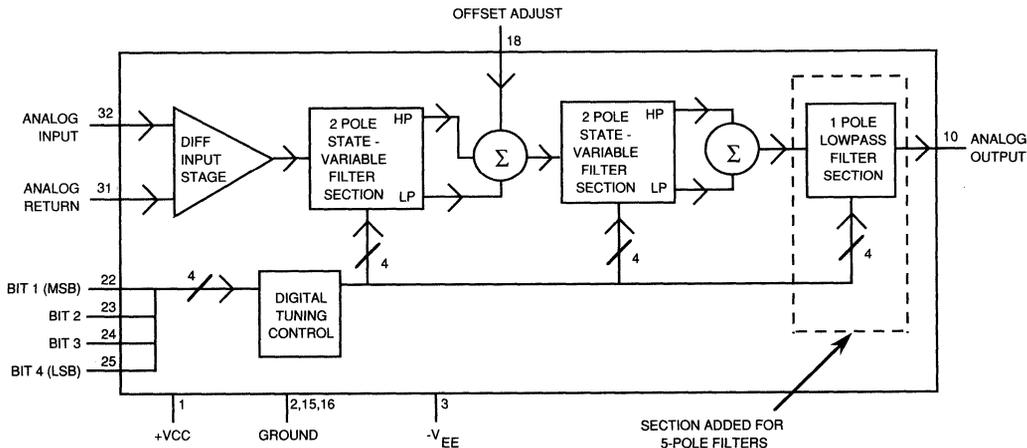

### MECHANICAL DIMENSIONS

INCHES (mm)

NOTE: Pins have 0.025 Inch  $\pm 0.01$  standoff from case.

| PIN   | FUNCTION      |
|-------|---------------|
| 1     | +VCC          |
| 2     | GROUND        |
| 3     | -VEE          |
| 4-9   | NO CONNECTION |
| 10    | ANALOG OUT    |
| 11-14 | NO CONNECTION |
| 15    | GROUND        |
| 16    | GROUND        |
| 17    | NO CONNECTION |
| 18    | OFFSET ADJUST |
| 19-21 | NO CONNECTION |
| 22    | BIT 1 (MSB)   |
| 23    | BIT 2         |
| 24    | BIT 3         |
| 25    | BIT 4 (LSB)   |
| 26-30 | NO CONNECTION |
| 31    | ANALOG RETURN |
| 32    | ANALOG INPUT  |

**ABSOLUTE MAXIMUM RATINGS**

| PARAMETERS                   | LIMITS      | UNITS |
|------------------------------|-------------|-------|
| +15V Supply (pin 1)          | -0.3 to +18 | V dc  |
| -15V Supply (pin 3)          | +0.3 to -18 | V dc  |
| Digital inputs (pins 22- 25) | -Vcc to +15 | Vdc   |
| Analog input (pin 31,32)     | -25 to +25  | V dc  |
| Lead temperature (10 sec.)   | 300         | °C    |
| Junction temperature (Tj)    | +175        | °C    |
| Storage Temperature          | -65 to +150 | °C    |
| Power dissipation            | 3           | Watts |

Stresses above the absolute maximum rating may cause permanent damage to the device. Extended operation at the maximum levels may degrade performance and affect reliability.

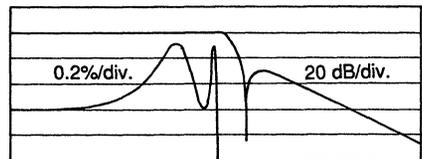

**FUNCTIONAL SPECIFICATIONS**

Apply at 25°C and at ±15Vdc power supply voltages unless otherwise specified.

- Bypass each power supply with a 0.1 microfarad tantalum electrolytic capacitor.
- Digital inputs are binary. The truth table (Table 1) details the cutoff frequency for each filter and for cascaded pairs of filters as a function of input coding.
- The frequency responses of the 4-pole and 5-pole Gauer filters are shown in Figures 2 and 3 respectively. Figure 4 details the response of a cascaded pair of frequency matched 4- and 5-pole filters. The response for a cascaded pair is similar to a 7-pole Gauer, as shown in Figure 5.
- When cascading a 4-and a 5-pole filter pair, the order of connection is not important. The filters must, however, be frequency matched.

### FEATURES

- State variable filter
- LP, BP, or HP functions
- 2-pole response
- Low-noise operational amplifiers
- -55°C to +125°C operation
- Low cost

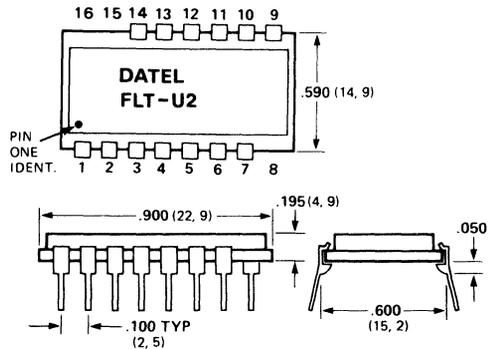

### GENERAL DESCRIPTION

The FLT-U2 is a universal active filter manufactured with a thick-film hybrid technology. It uses the state variable active filter principle to implement a second order transfer function. Three committed operational amplifiers are used for the second order function while a fourth uncommitted operational amplifier can be used as a gain stage, summing amplifier, buffer amplifier or to add another independent real pole.

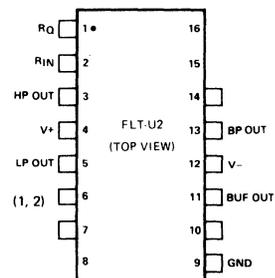

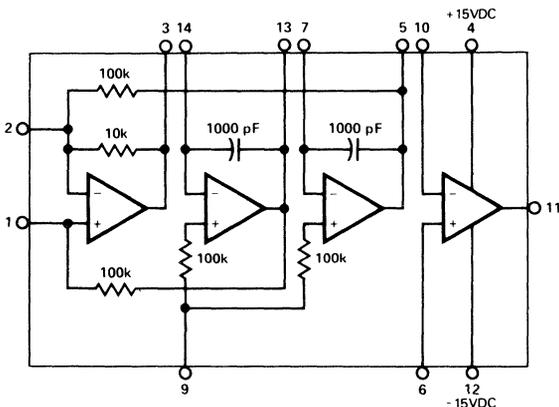

Two-pole low-pass, bandpass, and highpass output functions are available simultaneously from three different outputs, and notch and allpass functions are available by combining these outputs in the uncommitted operational amplifier. To realize higher order filters, several FLT-U2's can be cascaded. Q range is from 0.1 to 1,000 and resonant frequency range is 0.001Hz to 200kHz. Frequency stability is 0.01%/°C and resonant frequency accuracy is within ±5% of calculated values. Frequency tuning is done by two external resistors and Q tuning by a third external resistor. For resonant frequencies below 50Hz, two external tuning capacitors must be added. Exact tuning of the resonant frequency is done by varying one of the resistors around its calculated value.

The internal operational amplifiers in the FLT-U2 have 3 MHz gain bandwidth products and a wideband input noise specification of only 10nV/√Hz.

**TECHNICAL NOTES**

- The FLT-U2 has simultaneous lowpass, bandpass, and highpass output functions. The chosen output for a particular function will be at unity gain based on Tables II and III. This means that the other two unused outputs will be at other gain levels. The gain of the lowpass output is always 10 dB higher than the gain of the bandpass output and 20 dB higher than the gain of the highpass output.
- When tuning the filter and checking it over its frequency range, the outputs should be checked with a scope to make sure there is no waveform clipping present, as this will affect the operation of the filter. In particular the lowpass output should be checked since its gain is the highest.
- Check f<sub>1</sub>, the center frequency for bandpass and the cutoff frequency for lowpass or highpass, at the bandpass output. Here the peaking frequency can easily be determined for high Q filters and the 0° or 180° phase frequency can easily be determined for low Q filters (depending on whether inverting or noninverting).
- Tuning resistors should be 1% metal film resistors with 100 ppm/°C temperature stability or better for best performance. Likewise external tuning capacitors should be NPO ceramic or other stable capacitor types.

**THEORY OF OPERATION**

The FLT-U2 block diagram is shown in Figure 1. This is a second order state-variable filter using three operational amplifiers. Lowpass, bandpass, and highpass transfer functions are simultaneously produced at its three output terminals. These three transfer functions are characterized by the following second order equations:

$$H(s) = \frac{K_1}{S^2 + \frac{\omega_0}{Q} S + \omega_0^2} \quad \text{LOWPASS}$$

$$H(s) = \frac{K_2 S}{S^2 + \frac{\omega_0}{Q} S + \omega_0^2} \quad \text{BANDPASS}$$

$$H(s) = \frac{K_3 S^2}{S^2 + \frac{\omega_0}{Q} S + \omega_0^2} \quad \text{HIGHPASS}$$

where K<sub>1</sub>, K<sub>2</sub>, and K<sub>3</sub> are arbitrary gain constants.

A second order system is characterized by the location of its poles in the s-plane as shown in Figure 2. The natural radian frequency of this system is ω<sub>0</sub>. In Hertz this is f<sub>0</sub> =  $\frac{\omega_0}{2\pi}$ .

The resonant radian frequency of the circuit is different from the natural radian frequency and is:

$$\omega_1 = \omega_0 \sin \theta = \sqrt{\omega_0^2 - \sigma_1^2}$$

The damping factor d determines the amount of peaking in the filter frequency response and is defined as:

$$d = \cos \theta$$

The point at which the peaking becomes zero is called critical damping and is d =  $\sqrt{2}/2$ .

Q is found from d and is a measure of the sharpness of the resonance of the peaking:

$$Q = \frac{1}{2d}$$

$$\text{Also, } Q = \frac{f_0}{-3 \text{ dB Bandwidth}} = \frac{\omega_0}{2\sigma_1}$$

For high Q filters the natural frequency and resonant frequency are approximately equal.

$$\omega_1 \approx \omega_0 \text{ or } f_1 \approx f_0$$

This is true since ω<sub>1</sub> = ω<sub>0</sub> sin θ and sin θ ≈ 1 as the poles move close to the jω axis in the s-plane.

For high Qs (Q > 1) we therefore have for the second order filter:

$$\begin{aligned} f_0 &= \text{Bandpass center frequency} \\ &= \text{Lowpass corner frequency} \\ &= \text{Highpass corner frequency} \end{aligned}$$

In the simplified tuning procedure which follows, the tuning is accomplished by independently setting the natural frequency and Q of the filter. This is done most simply by assuming unity gain for the output of the desired filter function. Unity gain means a gain of one (±) at dc for lowpass, at center frequency for bandpass, and at high frequency (f > f<sub>0</sub>) for highpass. Unity gain does not apply to all outputs simultaneously but only to the chosen output based on the component values given in the tables. Figure 3 shows the relative gains of the three simultaneous outputs assuming the bandpass gain is set to unity. Note that lowpass gain is always 10 dB higher than bandpass gain and highpass gain is always 10 dB lower than bandpass gain.

**SIMPLIFIED TUNING PROCEDURE**

1. Select the desired transfer function (lowpass, bandpass, or highpass) and inverted or noninverted output. From this determine the filter configuration (inverting or noninverting) using Table I.

TABLE I FILTER CONFIGURATION

|                    |         |         |         |

| NONINVERTING INPUT | NON-INV | INV     | NON-INV |

2. Starting with the desired natural frequency and Q (determined from the filter transfer function or s-plane diagram), compute  $f_0Q$ . For  $f_0Q > 10^4$  the actual realized Q will exceed the calculated value. At  $f_0Q = 10^4$  the increase is about 1% and at  $f_0Q = 10^5$  it is about 20%.
3. **Inverting Configuration.** Using the value of Q from Step 2 find  $R_1$  and  $R_3$  from Table II.  $R_2$  is open, or infinite.

TABLE II INVERTING CONFIGURATION

|          |                  |       |                         |
|----------|------------------|-------|-------------------------|
|          | $R_1$            | $R_2$ | $R_3$                   |
| LOWPASS  | 100K             | OPEN  | $\frac{100K}{3.80 Q-1}$ |
| BANDPASS | $Q \times 31.6K$ | OPEN  | $\frac{100K}{3.48 Q}$   |
| HIGHPASS | 10K              | OPEN  | $\frac{100K}{6.64 Q-1}$ |

4. **Noninverting Configuration.** Using the value of Q from Step 2 find  $R_2$  and  $R_3$  from Table III.  $R_1$  is open, or infinite.

TABLE III NONINVERTING CONFIGURATION

|          |       |                   |                          |
|----------|-------|-------------------|--------------------------|
|          | $R_1$ | $R_2$             | $R_3$                    |
| LOWPASS  | OPEN  | $\frac{316K}{Q}$  | $\frac{100K}{3.16 Q-1}$  |
| BANDPASS | OPEN  | 100k              | $\frac{100K}{3.48 Q-1}$  |
| HIGHPASS | OPEN  | $\frac{31.6K}{Q}$ | $\frac{100K}{0.316 Q-1}$ |

5. Using the value of  $f_0$  from Step 2, set the natural frequency of the filter by finding  $R_4$  and  $R_5$  from the equation:

$$R_4 = R_5 = \frac{5.03 \times 10^7}{f_0}$$

where  $R_4$  and  $R_5$  are in ohms and  $f_0$  is in Hertz. The natural frequency varies as  $\sqrt{R_4 R_5}$  and therefore one value may be increased and the other decreased and the natural frequency will be constant if the geometric mean is constant. To maintain constant bandwidth at the bandpass output while varying center frequency, fix  $R_4$  and vary  $R_5$ .

6. For  $f_0 < 50$  Hz the internal 1000 pF capacitors should be shunted with external capacitors across pins 5 & 7 and 13 & 14. If equal value capacitors are used,  $R_4$  and  $R_5$  are then computed from:

$$R_4 = R_5 = \frac{5.03 \times 10^{10}}{f_0 C} \quad (C \text{ in pF})$$

For unequal value capacitors this becomes:

$$R_4 = R_5 = \frac{5.03 \times 10^{10}}{f_0 \sqrt{C_1 C_2}} \quad (C_1 C_2 \text{ in pF})$$

In both cases the capacitance is the sum of the external values and the internal 1000 pF values.

7. This procedure is based on unity gain output for the desired function. For additional gain, the fourth uncommitted operational amplifier should be used as an inverting or noninverting gain stage following the selected output. See Figure 4. A third pole on the real axis of the s-plane may also be added to the transfer function by adding a capacitor to the gain stage as shown in Figure 5.

**Figure 6.**  
**Realization of a Complex Multipole Filter**

**Figure 7.**  
**Realization of Notch Filter**

**ADVANCED FILTERS**

All of the common filter types can be realized by using cascaded FLT-U2 stages. This includes multi-pole Butterworth, Bessel, Chebyshev, and Elliptic types. The basic procedure is to implement each pole pair with a single FLT-U2 and cascade enough units to realize all poles. A real axis pole is implemented by an uncommitted operational amplifier stage. Each stage should be separately tuned with an oscillator and scope and then the stages connected together and checked. See Figure 6.

A notch filter can be constructed in several ways. The first way is to use the FLT-U2 as an inverting bandpass filter and sum the output of the filter with the input signal by means of the uncommitted operational amplifier. This produces a net subtraction at the center frequency of the bandpass which produces a null at the output of the amplifier. (see Figure 7). Likewise lowpass and highpass outputs (which are always in phase) can be subtracted from each other with an external operational amplifier. The highpass output must have some gain added to it, however, so that its gain is equal to that of the lowpass output. A third method is to use two separate FLT-U2's, one as a two-pole lowpass filter and the other as a two-pole highpass filter. Again the outputs are subtracted in an operational amplifier. This method permits independent tuning of the two sections to get the best null response.

| ORDERING INFORMATION |                              |
|----------------------|------------------------------|
| <b>MODEL</b>         | <b>OPERATING TEMP. RANGE</b> |
| FLT-U2               | 0°C to +70°C                 |
| FLT-U2M              | -55°C to +125°C              |

## PROCESS MONITORS/CONTROLLERS

DATEL designs and manufactures a complete line of Process Monitors/Controllers supporting Thermocouples, RTDs, Strain Gages, and Voltage/Current signal inputs. These low cost units contain such features as built-in RS-232 serial port (RS-422/485 optional), user-selectable setpoint outputs (up to 4 discrete and 1 optional Analog), built-in configuration and setup command set, fully isolated inputs (to 1500 Volts, typ.) and a six-character, 14-segment vacuum fluorescent display (blue-green). Each model may be configured and operated from either the front panel or via the serial port. For reliability, accuracy, and low price, DATEL's PM-5000 series Process Monitors/Controllers are simply the best.

## PANEL MOUNT THERMAL PRINTERS

## HIGH-RELIABILITY PROGRAMS

DATEL is committed to meeting the demanding requirements of military, aerospace, and severe environment applications. Toward that end, DATEL offers several options in its quality program.

### OPTION 1 — MIL-STD-883 Class H Compliant Devices

DATEL Inc. is **QUALIFIED** by the Defense Electronics Supply Center for the manufacture of selected hybrid microcircuits in **FULL COMPLIANCE** with Military Specification **MIL-H-38534** (Hybrid Microcircuits), FSC 5962, and **MIL-STD-1772 SECTION B**.

The accompanying chart gives a concise overview of MIL-STD-883 screening requirements and their implications for DATEL customers.

| TEST                     | METHOD  | PURPOSE  |
|--------------------------|---|--|
| Internal Visual (Precap) | Method 2017   | Eliminates devices with potential for failure under mechanical, electrical, or thermal stress.   |
| Stabilization Bake       | Method 1008, Test Condition C, 24 hrs. at 150 °C  | Eliminates device failure due to storage at elevated temperatures.   |
| Temperature Cycling      | Method 1010, Test Condition C, -65 to 150 °C  | Determines resistance of device to sudden exposure to extreme temperature changes. Removes potential failures due to thermal stress on bonds, etc. |
| Constant Acceleration    | Method 2001, Test Condition A, Y AXIS, 5 kg.  | Eliminates potential failures due to structural or mechanical weakness not detected in shock or vibration test.                                    |
| Burn-in Test             | Method 1015, Test Condition B, 160 hrs. at +125 °C  | Stresses devices at temperature in order to eliminate infant mortality failures.   |
| PDA 10%                  | Static Tests performed at +25 °C  | Percent defective allowable - Rejects lots with static test failures greater than 10%.   |
| Final Electrical Test    | Performed at +25 °C and at max. and min. operating temperatures   | Verifies that device still meets specified data sheet parameters.  |
| Seal Fine and Gross      | Method 1014, Test Condition A (fine), 1 x 10 <sup>-7</sup> cc/Sec. for volume of ≥0.5 to <1.0 cm <sup>3</sup> and 5 x 10 <sup>-8</sup> cc/Sec. for volume of ≥1.0 to <10.0 cm <sup>3</sup> . Test Condition C (gross) | Insures hermeticity of device package. Eliminates degradation due to absorption of water vapor or other contaminants.                              |
| External Visual          | Method 2009   | Insures that materials, design, construction, marking, and workmanship conform with applicable procurement documentation.                          |

MIL-STD-883 compliancy also requires that complete documentation be available to support the product. An analysis of the design along with element and package evaluations are performed to ensure a high quality product. The manufacturing process is also stringently controlled in order to obtain the high quality level.

Initial qualification requires passing the MIL-STD-883 test for groups A, B, C, and D. After initial qualification, groups A & B are tested for all lots. Group C is tested initially and to qualify any product changes which may occur. Group D testing is also performed initially and at intervals not exceeding 6 months for future lots.

## MIL-STD-883 PRODUCTS

### ANALOG-TO-DIGITAL CONVERTERS

| MODEL NO.      | RESOLUTION | CONVERSION TIME | LINEARITY     |
|----------------|------------|-----------------|---------------|
| ADC-HZ12B/883B | 12 Bits    | 8 $\mu$ Sec     | $\pm 1/2$ LSB |
| ADC-HX12B/883B | 12 Bits    | 20 $\mu$ Sec    | $\pm 1/2$ LSB |
| ADC-816/883B   | 10 Bits    | 800 nSec        | $\pm 1/2$ LSB |
| ADC-511/883B   | 12 Bits    | 1 $\mu$ Sec     | $\pm 3/4$ LSB |
| ADC-228/883B   | 8 Bits     | 4 nSec          | $\pm 1/2$ LSB |
| ADC-208/883B   | 8 Bits     | 50 nSec         | $\pm 1.5$ LSB |
| ADC-207/883B   | 7 Bits     | 50 nSec         | $\pm 1$ LSB   |
| ADS-111/883B   | 12 Bits    | 500 KHz         | $\pm 3/4$ LSB |

### DIGITAL-TO-ANALOG CONVERTERS

| MODEL NO.      | RESOLUTION | SETTLING TIME | LINEARITY     |
|----------------|------------|---------------|---------------|
| DAC-HZ12B/883B | 12 Bits    | 3 $\mu$ Sec   | $\pm 1/2$ LSB |
| DAC-HP16B/883B | 16 Bits    | 15 $\mu$ Sec  | $\pm 2$ LSB   |
| DAC-HK12B/883B | 12 Bits    | 3 $\mu$ Sec   | $\pm 1/2$ LSB |
| DAC-HF12/883B  | 12 Bits    | 50 nSec       | $\pm 1/2$ LSB |
| DAC-HF10/883B  | 10 Bits    | 25 nSec       | $\pm 1/2$ LSB |
| DAC-HF8/883B   | 8 Bits     | 25 nSec       | $\pm 1/2$ LSB |

### DATA ACQUISITION SUBSYSTEMS

| MODEL NO.    | RESOLUTION | INPUT CHANNELS | THROUGHPUT |
|--------------|------------|----------------|------------|
| HDAS-76/883B | 12 Bits    | 4 Diff.        | 75 KHz     |
| HDAS-75/883B | 12 Bits    | 8 SE           | 75 KHz     |
| HDAS-16/883B | 12 Bits    | 16 SE          | 50 KHz     |
| HDAS-8/883B  | 12 Bits    | 8 Diff.        | 50 KHz     |

### MULTIPLEXERS

| MODEL NO.   | CHANNELS | SETTLING TIME | ACCESS TIME |
|-------------|----------|---------------|-------------|
| MX-826/883B | 8 SE     | 200 nSec      | 70 nSec     |

### SAMPLE-AND-HOLD AMPLIFIERS

| MODEL NO.     | LINEARITY | ACQUISITION TIME | BANDWIDTH |
|---------------|-----------|------------------|-----------|
| SHM-4860/883B | 0.01%     | 200 nSec         | 16 MHz    |

## OPTION 2 — DATEL QL SCREENING PROGRAM

| TEST                          | TEST CONDITION   | PURPOSE  |
|-------------------------------|--|--|
| Internal Visual (100% Precap) | Test Method 2017   | Eliminate visual defects prior to seal                           |
| Stabilization Bake 100%       | TM 1008, Condition C 24 hours at + 150 °C (Optional if TM 1030 is used)              | Eliminates failures due to high temp storage                     |
| Temperature Cycling, 100%     | TM 1010, Condition C -65 to +150 °C, 10 cycles                                       | Eliminates failures due to mechanical weakness                   |
| 100% Constant Acceleration    | TM 2001, Condition A Y1 Axis, 5000 G   | Eliminates failures due to mechanical weakness                   |
| 100% Burn-in                  | Static burn-in 160 hrs. at +125 °C (Similar to TM 1015 or TM 1030)                   | Eliminates failures due to infant mortality                      |
| 100% Final Electrical Test    | Performed at +25 °C, TMIN, and TMAX operating temperatures                           | Verifies that devices meet specifications over temperature range |
| 100% Fine and Gross Leak      | Test Method 1014 Condition A (fine) 5 x 10 <sup>-7</sup> cc/Sec. Condition C (gross) | Insures hermeticity for high humidity environments               |
| 100% External Visual          | Test Method 2009   | Insures proper marking, construction, workmanship                |

### -QL PRODUCTS

#### SAMPLE-HOLD AMPLIFIERS

| MODEL NO.     | LINEARITY | ACQUISITION TIME | HOLD MODE DROOP |
|---------------|-----------|------------------|-----------------|
| SHM-45MM-QL   | 0.01%     | 200 nSec.        | 0.5 μV/μSec.    |
| SHM-4860MM-QL | 0.01%     | 200 nSec.        | 0.5 μV/μSec.    |
| SHM-6MM-QL    | 0.02%     | 2 μSec.          | 10 μV/μSec.     |
| SHM-HUMM-QL   | 0.1%      | 25 nSec.         | 50 μV/μSec.     |

#### OPERATIONAL AMPLIFIERS

| MODEL NO.    | INPUT OFFSET VOLTAGE | GAIN BANDWIDTH | OUTPUT        |
|--------------|----------------------|----------------|---------------|
| AM-500MM-QL  | 3 mV                 | 130 MHz        | +10V at 50 mA |
| AM-1435MM-QL | 5 mV                 | 1000 MHz       | + 7V at 14 mA |

#### DATA ACQUISITION SUBSYSTEMS

| MODEL NO.    | RESOLUTION | INPUT CHANNELS  | THROUGHPUT |
|--------------|------------|-----------------|------------|
| HDAS-16MM-QL | 12 Bits    | 16 Single-Ended | 50 KHz     |

### ANALOG-TO-DIGITAL CONVERTERS

| MODEL NO.      | RESOLUTION | CONVERSION TIME | LINEARITY     |
|----------------|------------|-----------------|---------------|
| ADC-817AMM-QL  | 12 Bits    | 2 $\mu$ Sec.    | $\pm 1$ LSB   |
| ADC-HX12BMM-QL | 12 Bits    | 20 $\mu$ Sec.   | $\pm 1/2$ LSB |
| ADC-HC12BMM-QL | 12 Bits    | 300 $\mu$ Sec.  | $\pm 1/2$ LSB |
| ADC-815MM-QL   | 8 Bits     | 700 nSec.       | $\pm 1/2$ LSB |
| ADC-825MM-QL   | 8 Bits     | 1 $\mu$ Sec.    | $\pm 1/2$ LSB |

### SAMPLING ANALOG-TO-DIGITAL CONVERTERS

| MODEL NO.      | RESOLUTION | SPEED  | LINEARITY     |
|----------------|------------|--------|---------------|
| ADC-HS12BMM-QL | 12 Bits    | 66 KHz | $\pm 1/2$ LSB |

### DIGITAL-TO-ANALOG CONVERTERS

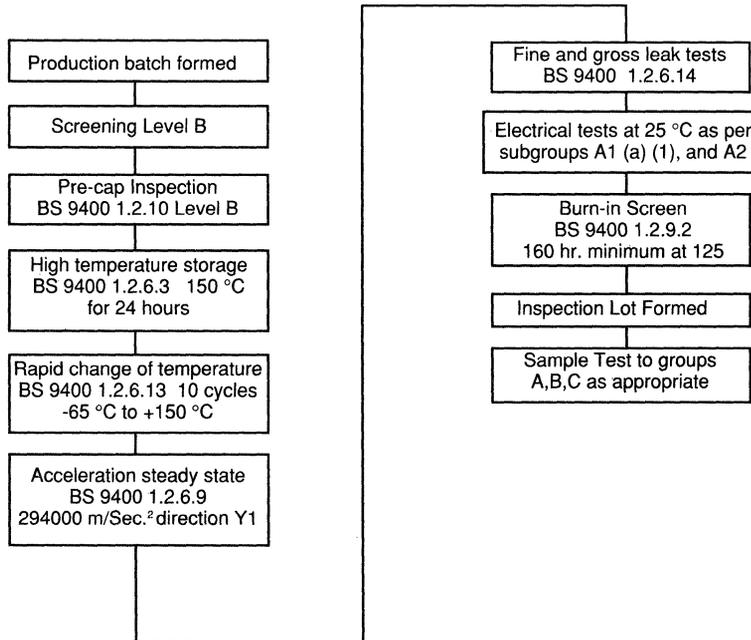

| MODEL NO.      | RESOLUTION | SETTLING TIME | LINEARITY     |
|----------------|------------|---------------|---------------|
| DAC-HP16BMM-QL | 16 Bits    | 15 $\mu$ Sec. | $\pm 2$ LSB   |
| DAC-HF12BMM-QL | 12 Bits    | 50 nSec.      | $\pm 1/2$ LSB |
| DAC-HK12BMM-QL | 12 Bits    | 3 $\mu$ Sec.  | $\pm 1/2$ LSB |
| DAC-HZ12BMM-QL | 12 Bits    | 3 $\mu$ Sec.  | $\pm 1/2$ LSB |
| DAC-HF10BMM-QL | 10 Bits    | 25 nSec.      | $\pm 1/2$ LSB |
| DAC-HF8BMM-QL  | 10 Bits    | 25 nSec.      | $\pm 1/2$ LSB |

### OPTION 3 — BS9000 PROGRAM

DATEL also has a BS9000 program in compliance with British Standards for high reliability devices. BS9000 is the United Kingdom's national system for the independent inspection approval and surveillance of manufacturers, distributors and test laboratories in the electronic component industry.

The accompanying product flow gives an overview of the BS9000 products through screening and quality conformance inspection.

### BS9000 Screening Requirements

### BS9000 PRODUCTS

#### ANALOG-TO-DIGITAL CONVERTERS

| MODEL NO.              | RESOLUTION | CONVERSION TIME | LINEARITY  |
|------------------------|------------|-----------------|------------|
| ADC-208MM-BS9400-G0140 | 8 BITS     | 66 nSec         | ±2 1/2 LSB |
| ADC-303MM-BS9400-G0106 | 8 BITS     | 10 nSec         | ±3/4 LSB   |
| ADC-303JM-BS9400-G0106 | 8 BITS     | 10nSec          | ±3/4 LSB   |
| ADC-304MM-B29400-G0177 | 8 BITS     | 50 nSec         | ±1/2 LSB   |

Parts qualified to the BS9000 specification have a quality level equivalent to MIL-M-38510 giving a quality factor of 1.

## DESC STANDARD MILITARY DRAWING PROGRAM

The Standard Military Drawing (SMD) program is a program administered by the Defense Electronics Supply Center (DESC) in Dayton, Ohio. Under this program a certified MIL-STD-1772 manufacturer, such as DATEL Inc., may supply a hybrid device using one government controlled Source Control Drawing (SCD). This saves both the customer and supplier time and effort.

DATEL Inc. is an active participant in the DESC SMD program. At publication time the following DESC Drawing numbers have been assigned and are approved or are pending approval. Please contact DATEL Inc. for current status and future SMD compliant products.

| DESC DRAWING NUMBER | DATEL MODEL NUMBER      |
|---------------------|-------------------------|
| 5962-88508          | ADC-HX/883B             |
| 5962-88508          | ADC-HZ/883B             |
| 5962-89528          | DAC-HKB/883B            |
| 5962-89528          | DAC-HKB-2/883B          |
| 5962-89531          | DAC-HPB/883B            |
| 5962-89531          | DAC-HPB-1/883B          |
| 5962-90857          | ADC-208/883B (pending)  |
| 5962-89996          | DAC-HF8/883B (pending)  |
| 5962-89996          | DAC-HF10/883B (pending) |
| 5962-89996          | DAC-HF12/883B (pending) |
| 5962-88514          | HDAS-8/883B (pending)   |
| 5962-88514          | HDAS-16/883B (pending)  |

## STILL AVAILABLE

The following older DATEL component products have not been included in this new databook. For new designs the component products offered in this databook will provide economically superior performance. For existing designs we at DATEL are committed to supplying our older products to our customers for as long as possible and practical. Please contact our Sales Department for information regarding price, delivery, and minimum order quantity on any of the following.

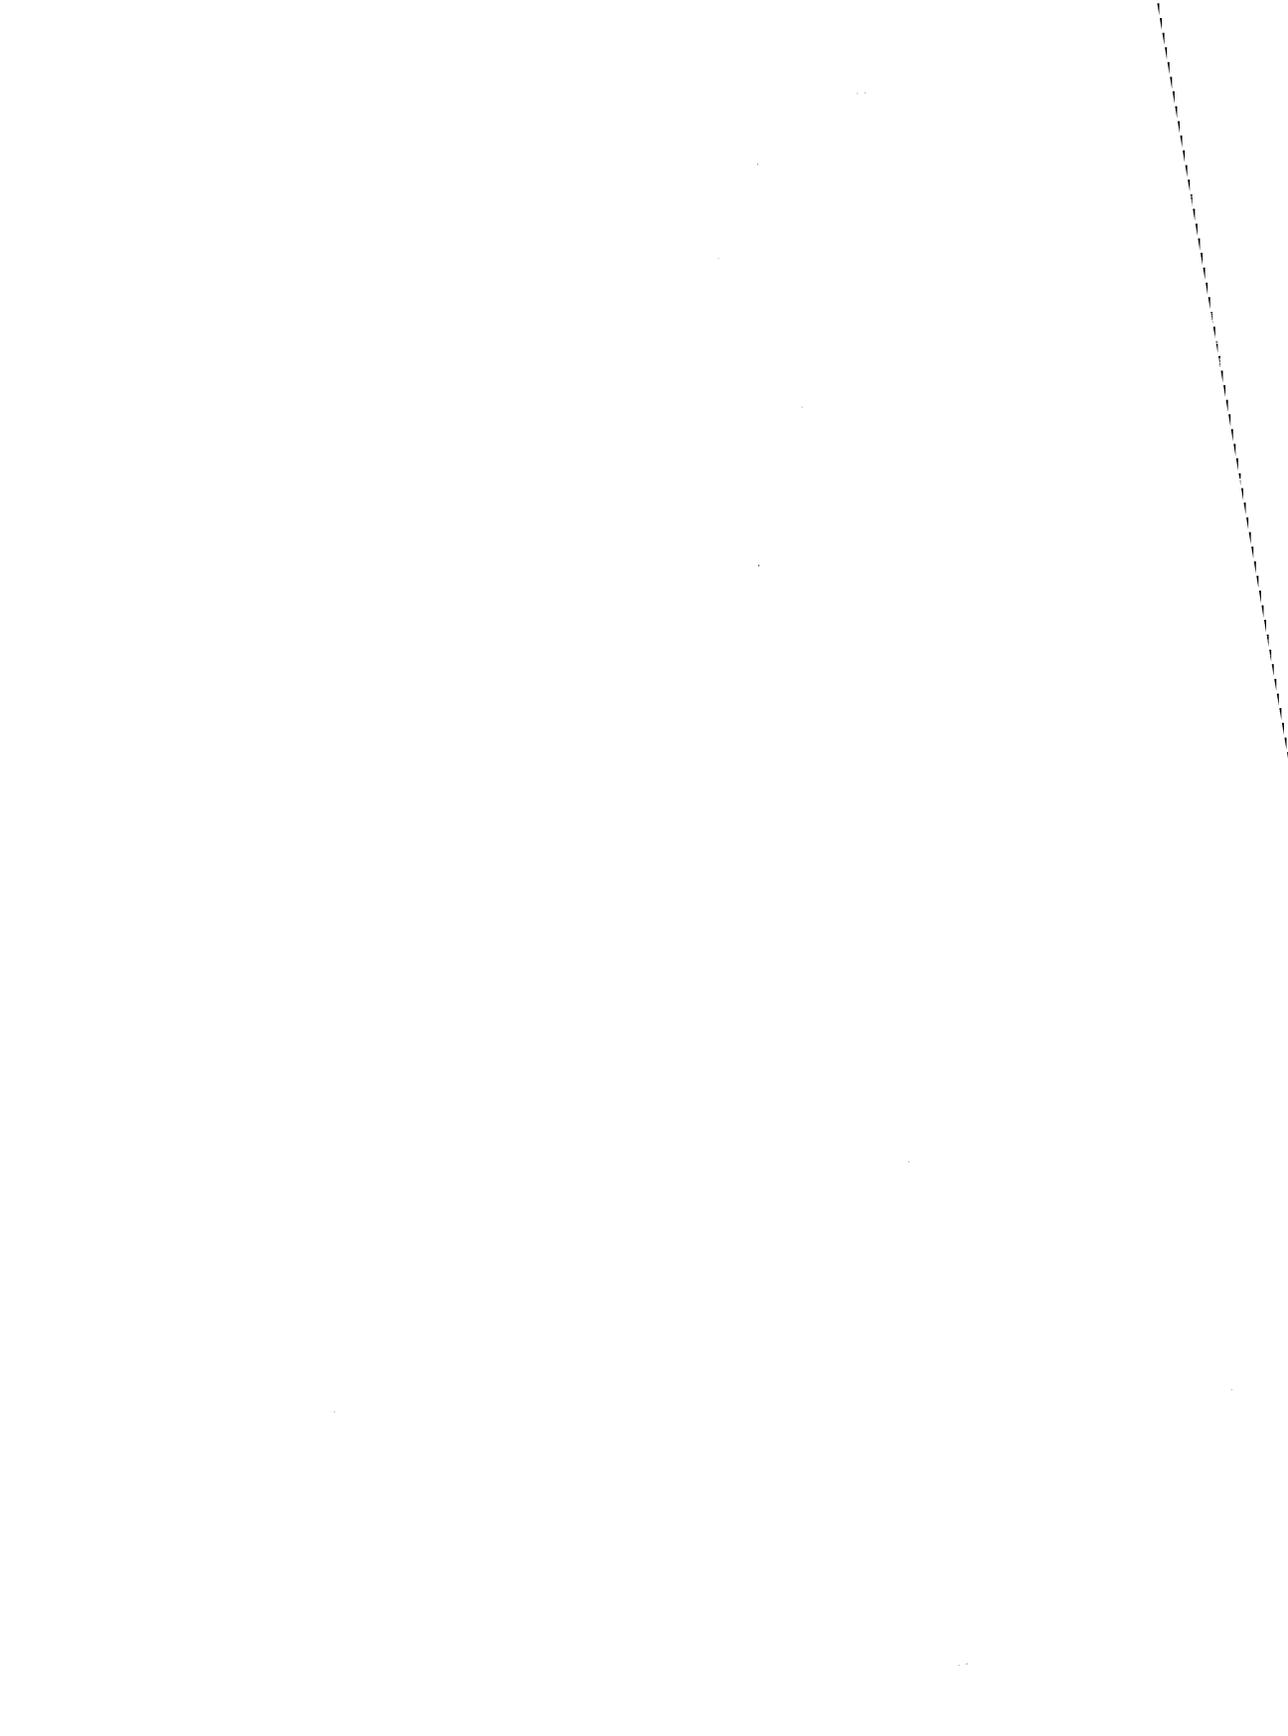

|                       |                        |                   |
|-----------------------|------------------------|-------------------|
| ADC-B500              | ADC-817AMM             | DAC-I12D          |

## SUBSTITUTION GUIDE FOR DISCONTINUED COMPONENT PRODUCTS

The following products are no longer available from DATEL. Where applicable, the nearest equivalent DATEL replacement is listed. Some of these replacement products are functionally similar only and may not be pin-for-pin compatible with the discontinued product.

| Discontinued Model  | Nearest Equivalent |
|---------------------|--------------------|
| ADC-300             | ADC-208            |
| ADC-301             | None               |
| ADC-302             | None               |
| ADC-303             | None               |
| ADC-310             | None               |

# GENERAL DISCLAIMER

DATEL Inc. reserves the right to make changes to its products and their specifications at any time, without prior notice to anyone.

DATEL Inc. has made every effort to ensure accuracy of the information contained in this databook, but can assume no responsibility for inadvertent errors, omissions, or subsequent changes.

DATEL Inc. does not assume any responsibility for the use of any circuitry or other information described within this databook, and further, makes no representations of any kind that the circuitry and information described herein is free of infringement of any intellectual property right or any other right of third parties. No express or implied license of any DATEL Inc. intellectual property right is granted by implication or otherwise.

## LIFE SUPPORT AND NUCLEAR FACILITY APPLICATIONS POLICY

*DATEL Inc. products are not for and should not be used within life support systems or nuclear facility applications without the specific written consent of DATEL Inc.*

A Life Support system is a product or system intended to support or sustain life and which if it fails can be reasonably expected to result in significant personal injury or death. Nuclear Facility applications are defined as any application involving a nuclear reactor or any facility involved in any way with the handling or processing of radioactive materials and in which the failure of equipment in any way could reasonably result in harm to life, property or the environment.

## ORDERING GUIDE

*This ordering guide is presented as a procedural guide. For a formal statement of policies, refer to the TERMS AND CONDITIONS OF SALE found on the Quotation form or on the Customer Acknowledgement copy of the Sales Order.*

### PLACING AN ORDER

When ordering a DATEL product, give the complete model number, product description, and option description. Place orders with a DATEL field sales representative or with the factory by letter, telephone, FAX, or TELEX. *Minimum order and minimum per shipment is \$100.*

**OUTSIDE THE U.S.A. AND CANADA** Place overseas orders with a DATEL Sales Subsidiary (in West Germany, France, the United Kingdom, and Japan) or with a DATEL overseas sales representative. Orders received directly will be treated the same as if placed through our overseas sales representative. In countries without a DATEL representative, orders should be placed by TELEX and confirmed by air mail.

### FIELD SALES REPRESENTATIVE

DATEL employs field sales representatives throughout the United States, Canada, Europe, and the Far East. DATEL also has Sales Subsidiaries in Munich, West Germany; Paris, France; London, England; and Tokyo and Osaka, Japan. Only these sales representatives are authorized by DATEL to solicit sales, and any information or data received by sources other than these authorized representatives or the DATEL factory are not considered binding.

### PRICES

All prices are F.O.B., Mansfield, Massachusetts, U.S.A. in U.S. dollars. Applicable federal, state, and local taxes are extra and paid by buyer. Prices are subject to change without notice.

**TERMS** Net 30 days

### DISCOUNTS

Quantity discounts are available when placed in a single order. OEM discounts are available on an order or contract basis; consult the factory for details

### QUOTATIONS

Price and delivery quotations made by DATEL or its authorized field sales representatives are valid for 30 days unless otherwise stated.

### DELIVERY

DATEL uses an IBM System 4381, for efficient processing of orders. All orders placed with DATEL are acknowledged within a few days by an acknowledgement copy of our sales order form. This copy indicates pertinent information including a formal statement of terms and conditions of sale and estimated delivery date. This date has preference over all other agreed upon dates unless otherwise specified.

DATEL ships all products in rugged commercial containers suitable for insuring safe delivery under normal shipping conditions. Unless shipping method is specified, the best available method will be used. Shipping charges are normally prepaid and billed to the customer except for Air Freight charges which are sent collect. The appropriate data sheet and/or instruction is packed with each product shipped.

### ORDER CANCELLATION

All orders entered with DATEL are binding and are subject to a cancellation charge if cancelled before or after the scheduled shipping date appearing on the acknowledgement copy of the sales order form. Refer to DATEL's Standard Terms and Conditions for specific charges.

### WARRANTY

DATEL warrants that all of its products are free from defects in material and workmanship under normal use and service for a period of one year from date of shipment. DATEL's obligations under this warranty are limited to replacing or repairing, at its option, at its factory or facility, any of the products which shall within the applicable period after shipment be returned to DATEL's facility, transportation charges prepaid, and which are after examination disclosed to the satisfaction of DATEL to be thus defective. This warranty shall not apply to any such equipment which shall have been repaired or altered except by DATEL or which shall have been subjected to misuse, negligence, or accident. In no case shall DATEL's liability exceed the original purchase price. The aforementioned provisions do not extend the original warranty period of any product which has either been repaired or replaced by DATEL.

### RETURNS

You will need a **return authorization number** and shipping instructions from the factory when returning products for any reason. Items should not be returned air freight collect as they cannot be accepted. It is absolutely necessary to return products in the manner stated here, otherwise considerable delay will result in processing the return.

**RETURNS OUTSIDE THE U.S.A. AND CANADA** Contact the local sales representative or factory for authorization and shipping instructions first.

### CERTIFICATE OF COMPLIANCE

When requested by the customer DATEL will provide a standard Certificate of Compliance with all shipments. This request must be specified on the purchase order.
