FUNCTIONAL DESCRIPTION

OVERVIEW

The MB88341 and MB88342 are R-2R resistor ladder type, 8-bit resolution digital-to-analog converter (DAC) devices. The MB88341 has 12 channels, and MB88342 has 8 channels of D/A converters. 8-bit digital data are loaded into internal data latches by individual DAC channel units. The loaded digital data are converted into analog DC voltages through the internal D/A converter in 60 μ s settling time. For cascade connection, a serial data output is provided.

DEVICE CONFIGURATION

As illustrated in Figure 2 block diagram, the MB88341 (MB88342) device is composed by the digital block (MCU interface) and analog block (D/A converter). The digital block consists of a 12-bit shift register, a 4-bit address latch/decoder, and 12 (8) 8-bit data latches. The analog block includes 12 (8) 8-bit D/A converters connecting to the data latches. For electrically stable operation the power supply and ground lines are separate between the digital block (for MCU interface) and analog block (for D/A converter).

DEVICE OPERATION

Figure 3 shows the input/output timing. A 12-bit address/data is serially input into the shift register through the DI pin synchronously with the rising edge of CLK. The format of the shift register is shown in Figure 4. The lower 8 bits (D7 to D0) are data bits to be converted, and the upper 4 bits (D11 to D8) are address bits (D11 to D8) to select a data latch to be written. A high level on the LD pin loads the address latch/decoder with the 4-bit address to select a data latch, and writes the 8-bit data into a selected data latch. Figure 5 shows the data latch address map, and Table 2, address decoding. 8-bit data written into individual data latches are converted into analog DC voltages, dividing the supply voltage $|V_{DD}-V_{SS}|$ through R-2R resistor ladders of D/A converters. Figure 6 shows the R-2R resistor ladder D/A converter configuration, and Table 3 analog DC voltages corresponding to each digital data.
